# 1、Preface

## 1.1 Getting Started guide

To describe operation of motor independent action in PP mode (Profile Position Mode)

### 1) Connection preparation

- a) Please connect master and slave, slave and motor.
- b) The EtherCAT communication needs to record the ESI file of EtherCAT slave station (ask for it from our company).
- c) The main station is to generate ENI with the configuration file according to the ESI file provided by our company, and then constitute the EtherCAT network.
- d) Set Station Alias, Configured Station Alias (0004h) of SII is 0.
- e) Power on and check if there's alarm.

### 2) Communication setup

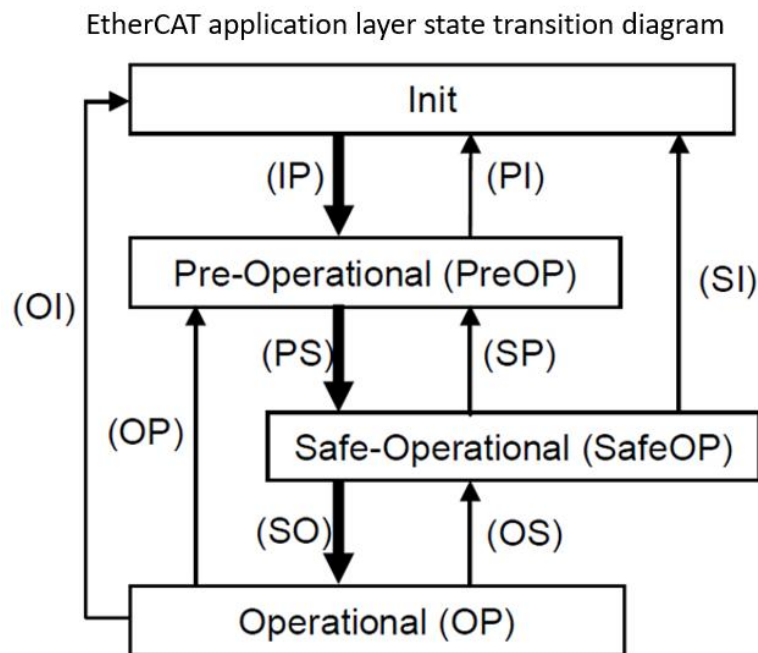

- a) According to ENI file, the master station performs communication initialization。 As an example of setting, the following Settings are required under DC mode.

(DC mode, 2ms cycle, the time to lock the data=100us)

1C32h-01h = 2(DC)、1C32h-02h = 2000000(ns)

1C33h-01h = 2(DC)、1C33h-03h = 100000(ns)

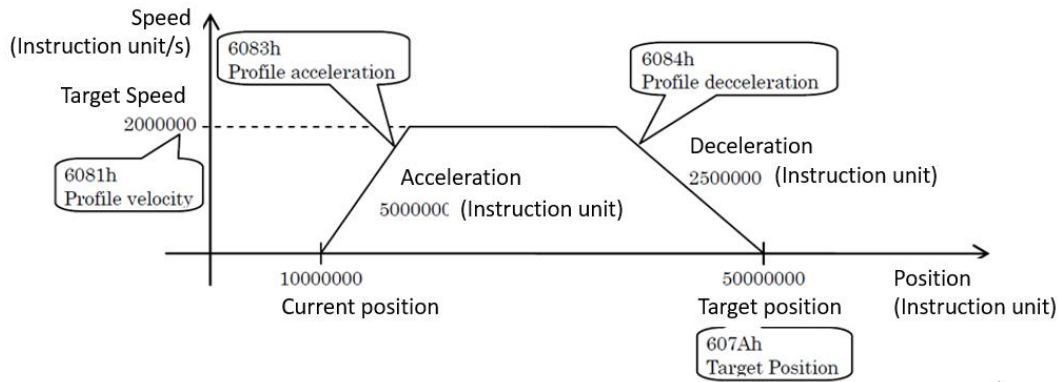

- b) Execute the ESC register setting, and the ESM state is transformed from Init to PreOP
- c) Confirm the ESM status into PreOP, execute ESC register setting (DC, PDO, use SM etc.), and convert the ESM state from PreOP to SafeOP.
- d) After confirming that the ESM state enters the SafeOP, transformed the ESM state from SafeOP to OP.

### 3) Object setting

Under the control of PP, the setting example of absolute positioning action shown below is described as follows:

- a) Set control mode (6060h:Modes of operation = 1)。
- b) Set the target position (607Ah:Target Position = 5000000 instruction unit)。
- c) Set the target speed (6081h:Profile Speed = 200000 instruction unit/s)。
- d) Set acceleration (6083h:Profile Speed = 5000000 instruction unit/s/s)。
- e) Set deceleration (6084h:Profile Speed = 2500000 instruction unit/s/s)。

#### 4) Motor action

The EtherCAT communication is the so-called PDS(Power Drive Systems) state, which represents the state of the servo Drive.PDS can be changed through object 6040h(Controlword) and can be referenced by 6041h(Statusword).It is necessary to send the instructions to the next state only after the state has been converted through 6041h(Statusword).

- a) The PDS state is transformed from Switch on disabled to Ready to Switch on.

Set 6040h=0006h (2: Shutdown), and confirm that 6041h is changed from xx40h to xx21h.

- b) The state of PDS is switched from Switch on disabled to Switch on.

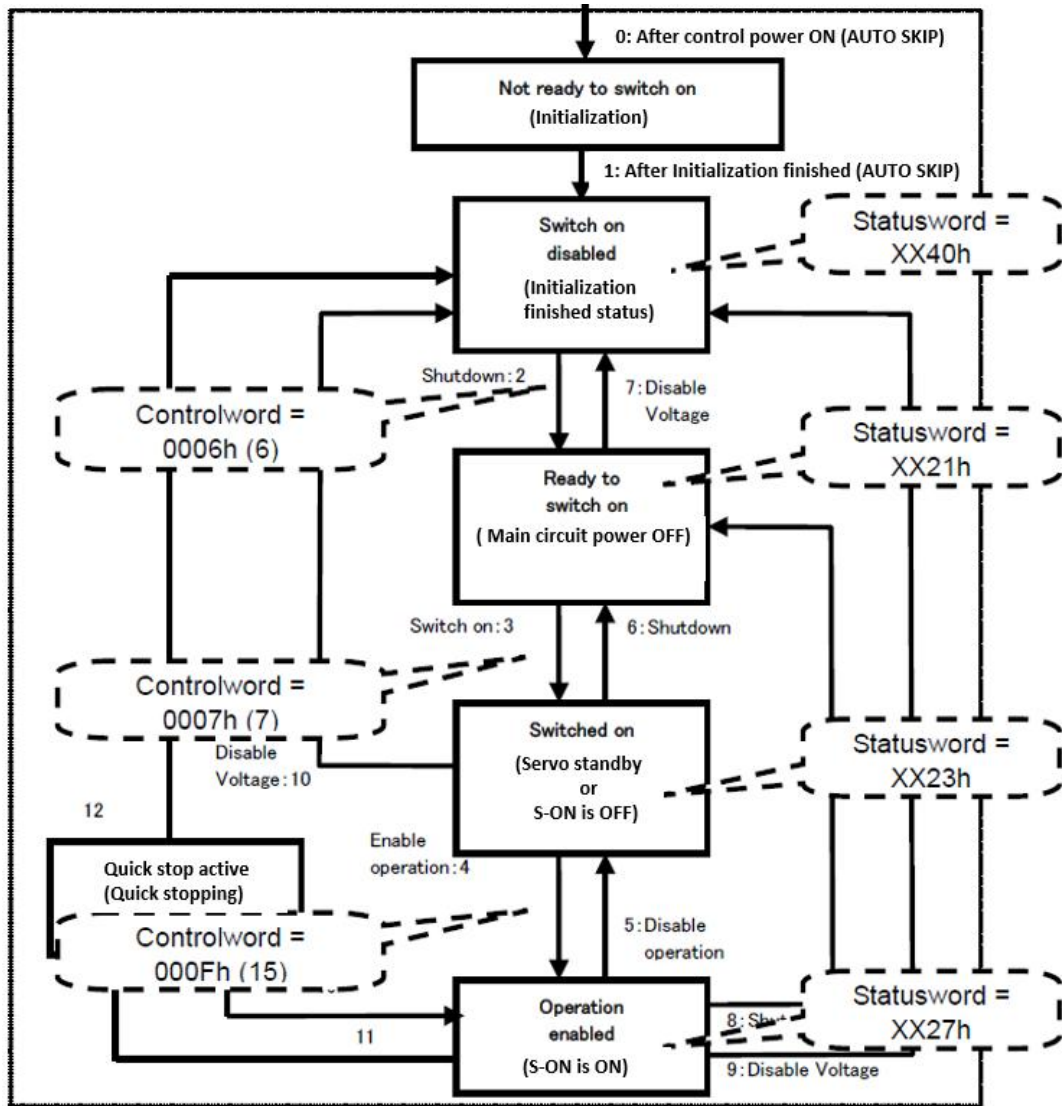

Set 6040h=0007h (3: Switch on), and confirm that 6041h changed from xx21h to xx23h.

- c) The state of PDS is converted from Switch on disabled to operation enabled.

Set 6040h=000Fh (4: Enable operation), and confirm that 6041h is changed from xx23h to xx27h, and the servo enables ON.

- d) Because of the start of PP movement, change bit4(new set point) of 6040h from 0 to 1, bit5(change set immediately), bit6(abs/rel), and bit9(change on set-point) keep as 0, please set 6040h=001Fh.

- e) The servo on is closed by switching the PDS state from Operation enabled to Switched on.Set 6040h=0007h(5: Disable operation), and confirm that 6041h is changed from xx27h to xx23h.

5) If the motor does not move.

If the servo does not enable ON, please confirm the PDS state within the drive.

If the servo ON enabled, but the motor does not move, then the object setting may be wrong or omitted, please confirm the set value of the object.

If the alarm is sent, please remove the alarm first.

## 2、 System overview

### 2.1 EtherCAT overview

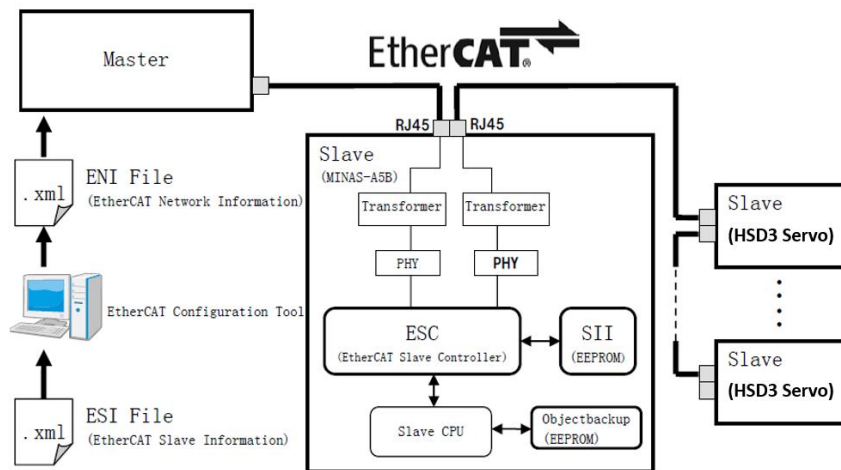

The so-called EtherCAT is the abbreviation of Ethernet for Control Automation Technology. Adopt real-time Ethernet open network communication between master and slave stations developed by Beckhoff Automation GmbH, and managed by ETG.

### 2.2 System constitute (Master\* slave)

EtherCAT's connection system is linear network system between the master station and multiple slave stations

The number of slave station nodes that can be connected depends on the master station processing or communication cycle, the number of bytes transferred, and so on. Please refer to the matching master station specification for confirmation.

The master station is based on the ESI file provided by the company to generate the ENI file and use ENI to form the EtherCAT network.

#### EtherCAT Slave Information (ESI):

The company provides documents in XML format that record the definition of information from the slave station (manufacturer's information, product information, Profile, object, process data, availability cycle, SM setting, etc.).

#### EtherCAT Network Information (ENI):

The document on the side of the master station contains information that identifies the slave station information and the information of initialize each slave station.

#### Slave Information Interface (SII):

ESC connected the EEPROM of record SII data. In this EEPROM (SII), the setted initialization information, the specification value set by the application communication of slave station (the data size value of the Mailbox), the mapping of process data, and so on.

(Note) : The cable length between nodes is within 100m.

## 2.3 Specification overview

Item	Specification																						
The physical layer	100BASE-TX (IEEE802.3)																						
Baud rate	100[Mbps] (Full duplex)																						
The topology	LINE																						
Connection cable	Twisted CAT5e																						
Cable length	Node: Max 100m.																						
Conneted axis numble	Max: 65535																						
Communication interface	2ports (RJ45)																						
EtherCAT Indicators (LED)	[RUN] One of the eight digital tubes. [ERR] No corresponding [L/A IN] One of the eight digital tubes. [L/A OUT] One of the eight digital tubes.																						
Station Alias (ID)	0 ~ 65535																						
Explicit Device ID	Corresponding																						
Device Profile	CoE (CANopen over EtherCAT)																						
SyncManager	4																						
FMMU	3																						
Operation mode	<table border="1"> <thead> <tr> <th colspan="3">Modes of operation</th> </tr> </thead> <tbody> <tr> <td rowspan="4">Position</td> <td>pp</td> <td>Profile position mode</td> </tr> <tr> <td>csp</td> <td>Cyclic synchronous position mode</td> </tr> <tr> <td>ip</td> <td>Interpolate position mode</td> </tr> <tr> <td>hm</td> <td>Homing mode</td> </tr> <tr> <td rowspan="2">Speed</td> <td>pv</td> <td>Profile speed mode</td> </tr> <tr> <td>csv</td> <td>Cyclic synchronous speed mode</td> </tr> <tr> <td rowspan="2">Torque</td> <td>tq</td> <td>Torque profile mode</td> </tr> <tr> <td>cst</td> <td>Cyclic synchronous torque mode</td> </tr> </tbody> </table>	Modes of operation			Position	pp	Profile position mode	csp	Cyclic synchronous position mode	ip	Interpolate position mode	hm	Homing mode	Speed	pv	Profile speed mode	csv	Cyclic synchronous speed mode	Torque	tq	Torque profile mode	cst	Cyclic synchronous torque mode
Modes of operation																							
Position	pp	Profile position mode																					
	csp	Cyclic synchronous position mode																					
	ip	Interpolate position mode																					
	hm	Homing mode																					
Speed	pv	Profile speed mode

Torque	tq	Torque profile mode																					
	cst	Cyclic synchronous torque mode																					
ouch Probe	2ch Positive edge/Negative edge																						
Synchronous mode	DC SM2 FreeRUN																						
Cycle Time(DC、SM2)	100, 200, 500, 1000, 2000, 4000 [us]																						
Communication object	SDO, PDO																						
SDO information	SDO Request, SDO Response, SDO information, Diagnostic information, Complete Access																						
Free PDO Mapping	Corresponding																						
Maximum PDO distribution number	RxPDO: 4 [Table] TxPDO: 4 [Table]																						
Maximum PDO data length	RxPDO: 32 [byte] TxPDO: 32 [byte]																						
Diagnosis Object	Only corresponding diagnosis message																						
Command Object	No corresponding																						
Shift time	The 100us moment is just corresponding Input(response)																						
CSP position command compensation when communication is abnormal.	No corresponding																						
Object monitoring	Corresponding																						

# 3、EtherCAT communication specifications

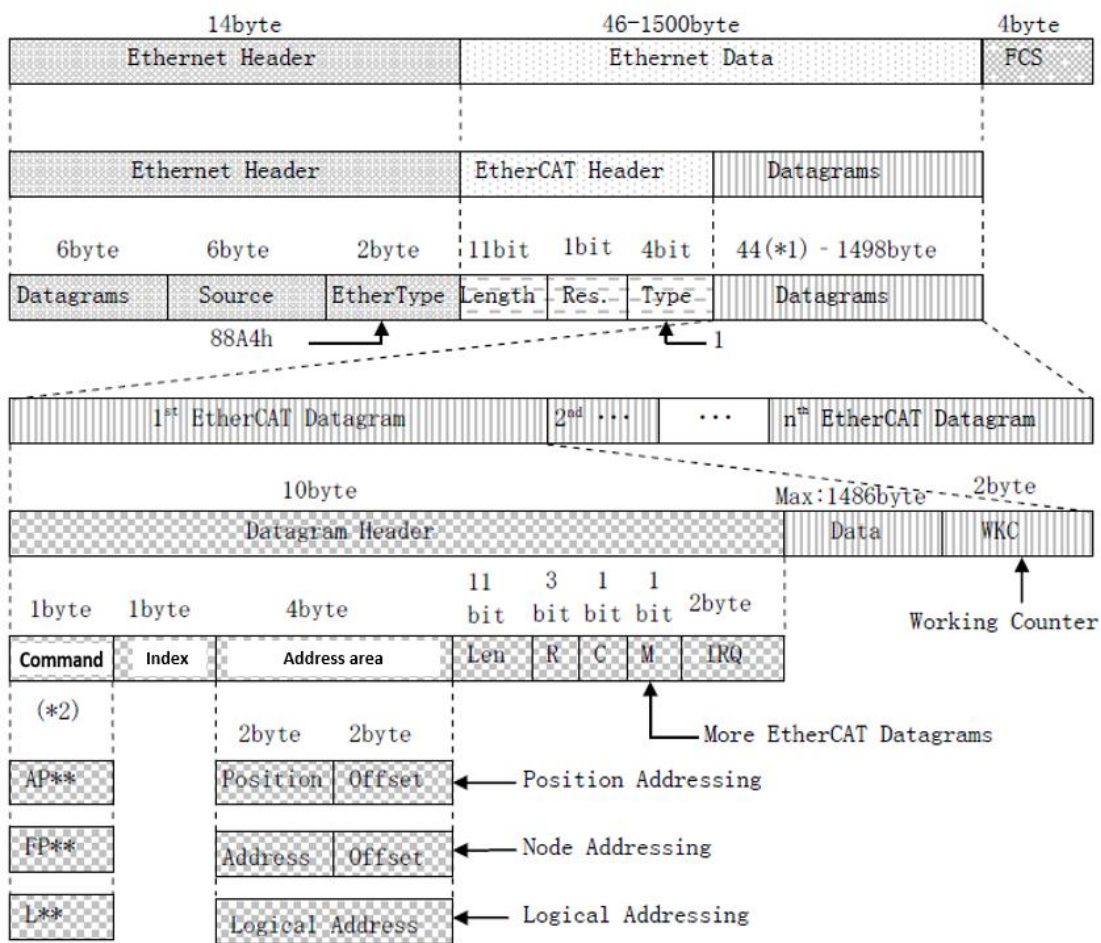

## 3.1 EtherCAT frame structure

EtherCAT is an industrial communication protocol based on Ethernet that can be controlled in real time.

Only the IEEE 802.3 Ethernet specification is expanded, and no changes are made to the basic structure. Therefore, data in the standard Ethernet frame can be forwarded. Since the EtherType of the Ethernet Header is [88A4h], the subsequent Ethernet Data is treated as an EtherCAT frame. An EtherCAT frame is composed of an EtherCAT frame header and one or more EtherCAT submessages, and is further subdivided into EtherCAT submessages. Only the EtherCAT frames with Type=1 of the EtherCAT header are processed according to the ESC.

\*1) Ethernet packet is shorter than 64byte, add 1-32byte。 (Ethernet Header + Ethernet Data + FCS)

### Ethernet/EtherCAT frame form

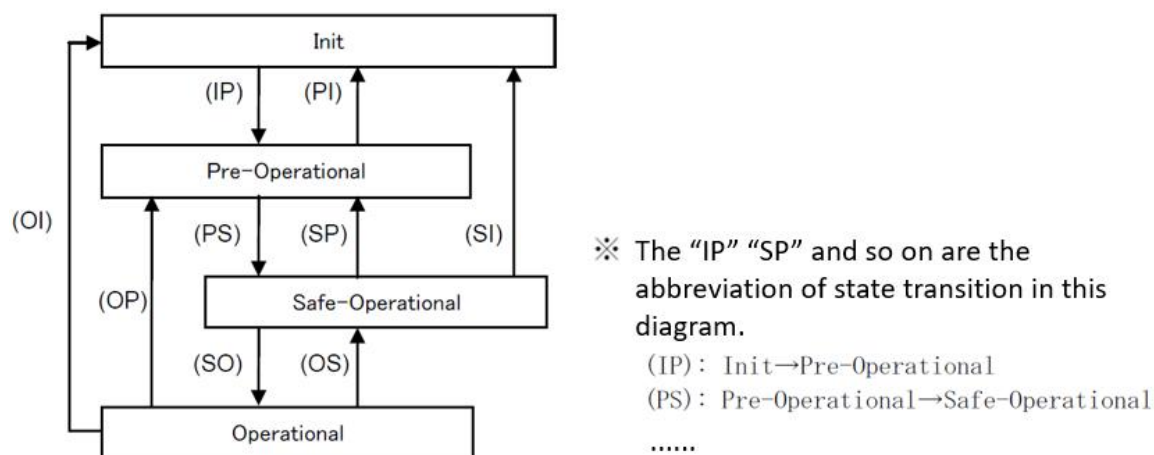

\*2) Cmd

Addressing mode	Cmd	Abbreviation	Name	Description
-	00h	NOP	No operation	No operation
Position Addressing	01h	APRD	Auto increment physical read	Each slave station increments Address and receives a frame with an Address value of 0. Perform the requested read action.
	02h	APWR	Auto increment physical write	Each slave station increments Address and receives a frame with an Address value of 0. Perform the requested write action.
	03h	APRW	Auto increment physical read write	Each slave station increments Address and receives a frame with an Address value of 0. Perform the required read & write actions.
Node Addressing	04h	FPRD	Configured address physical read	Each slave station has the same value of Address and Station Address. Perform the requested read action.
	05h	FPWR	Configured address physical read	Each slave station has the same Address value and Station Address. Perform the requested write action.
	06h	FPRW	Configured address physical read write	Each slave station has the same value of Address and Station Address. Perform the required read & write actions.
-	07h	BRD	Broadcast read	All slaves perform the requested read action
	08h	BWR	Broadcast write	All slaves perform the requested write action
	09h	BRW	Broadcast read write	All slaves perform the required read & write actions
Logical Addressing	0Ah	LRD	Logical read	Each slave station executes the requested read action when the Address value matches the logical memory specified by the FMMU request.
	0Bh	LWR	Logical write	Each slave station performs the requested write operation when the Address value matches the logical memory specified by the FMMU request.
	0Ch	LRW	Logical read write	Each slave station performs the requested read & write operation when the Address value matches the logical memory specified by the FMMU request.
Position Addressing	0Dh	ARWM	Positional physical read/multiple write	Each slave station increments the Address, and the slave station whose Address value receives 0 completes the required read action, and the other slaves perform the write action.
Node Addressing	0Eh	FRMW	Configured address physical read /multiple write	The slave Address and Station Address values are compared, the consistent slave performs the requested read action, and the other slaves execute the write action.
-	0Fh ~ FFh	-	(Reserved)	

## 3.2 ESM (EtherCAT State Machine) state machine

The conversion diagram of the state machine (ESM) of the EtherCAT application layer is as follows:

EtherCAT application layer state transition diagram

ESM state	Actions acquired in each state	Communication action		
		SDO Send and receive	PDO (S to M)	PDO (M to S)
Init	In the initialization of the communication module, SDO transceivers and PDOs cannot be sent or received.	--	--	--
Pre-Operational (PreOP)	SDO can send and receive actions	Yes	--	--
Safe-Operational (SafeOP)	In addition to SDO transceiving, the status of the signaling (slave to master) via PDO can be	Yes	Yes	--
Operational (OP)	SDO Transceiver, PDO Transceiver All Possible Status	Yes	Yes	Yes

Access from the master station to the ESC register is irrelevant to the above table.

When the ESM state transitions from the OP to other ESM states, before completion of the conversion, if the instruction update is stopped or the SYNC0, SM2 events are stopped, there is a possibility of sending a communication abnormality.

The relationship between each PDS status and ESM status is shown in the following table:

PDS state	ESM state			
	Init	PreOP	PreOP	OP
Not ready to switch on	Yes	No	No	No
Switch on disabled	Yes	Yes	Yes	Yes
Ready to switch on	No	Yes	Yes	Yes
Switched on	No	Yes	Yes	Yes
Operation enabled	No	Yes	Yes	Yes
Fault reaction active	Yes	Yes	Yes	Yes
Fault	Yes	Yes	Yes	Yes

### 3.3 ESC address space

HNC-E holds 8 Kbytes of physical address space. The first 4K (0000h-0FFFh) is used as a register space, and the other 4Kbyte is a process data used as a RAM area. The registers are as follows:

ESC Register Byte Address	Length (byte)	Description	Initial value
ESC Information			
0000h	1	Type	04h
0001h	1	Revision	02h
0002h~0003h	2	Build	0040h
0004h	1	FMMUs supported	03h
0005h	1	SyncManagers supported	04h
0006h	1	RAM size	08h
0007h	1	Port Descriptor	0Fh
0008h-0009h	2	ESC Features supported	0184h
Station Address			
0010h-0011h	2	Configured Station Address	-
0012h-0013h	2	Configured Station Alias	-
:

09A4h-09A7h	4	SYNC1 Cycle Time	

### 3.4 SII(Slave Information Interface)EEPROM

The HSD7-E loads 16Kbit EEPROM for storing EtherCAT slave information (ESI). The following table shows the configuration of the EEPROM. ESI uses word addresses.

SII EEPROM Word Address	+0h	+1h	+2h	+3h	+4h	+5h	+6h	+7h
0000h	EtherCAT Slave Controller Configuration Area							
0008h	Vendor ID		Product Code		Revision Number		Serial Number	
0010h	Hardware Delays				Bootstrap Mailbox Config			
0018h	Mailbox Sync Man Config					Reserved		
0020h : 0030h	Reserved							
0038h	Reserved						Size	Version
0040h :	Additional Information							
	Category Strings							
	Category Generals							
	Category FMMU							
	Category SyncManager							
	Category TxPDO/RxPDO for each PDO							

In the ESC register configuration area (EEPROM word address 0000h-0007h), the Configured Station Alias is automatically read by the ESC after the power is turned on and written in the ESC register. When the changed value of the SII EEPROM is reflected in the ESC register, turn on the power again.

SII EEPROM Byte Address	Name	Description	ESC Register Word Address	Data type	Initial value
0000h	PDI Control	Initial value of PDI control register	0140h 0141h	Unsigned16	0E8Dh
0001h	PDI Configuration	Initial value of PDI configuration register	0150h 0151h	Unsigned16	CC84h
0002h	Pulse Length of Sync	The initial value of the pulse width of the SYNC signal	0982h 0983h	Unsigned16	0064h
0003h	Extended PDI Config	Expand the initial value of the PDI configuration register	0152h 0153h	Unsigned16	0000h
0004h	Configured Station Alias	Station Alias (ID) initial value	0012h 0013h	Unsigned16	0000h
0005h	Reserved	Reserved	—	Unsigned16	8000h
0006h	Reserved	Reserved		Unsigned16	—
0007h	Chechsum	Verification of ESC register configuration area	—	—	—

003Fh	Version	version	——	Unsigned16	0001h

## 3.5 Communication synchronization mode

The E\*-\*\*A30 series can support the following synchronization modes.

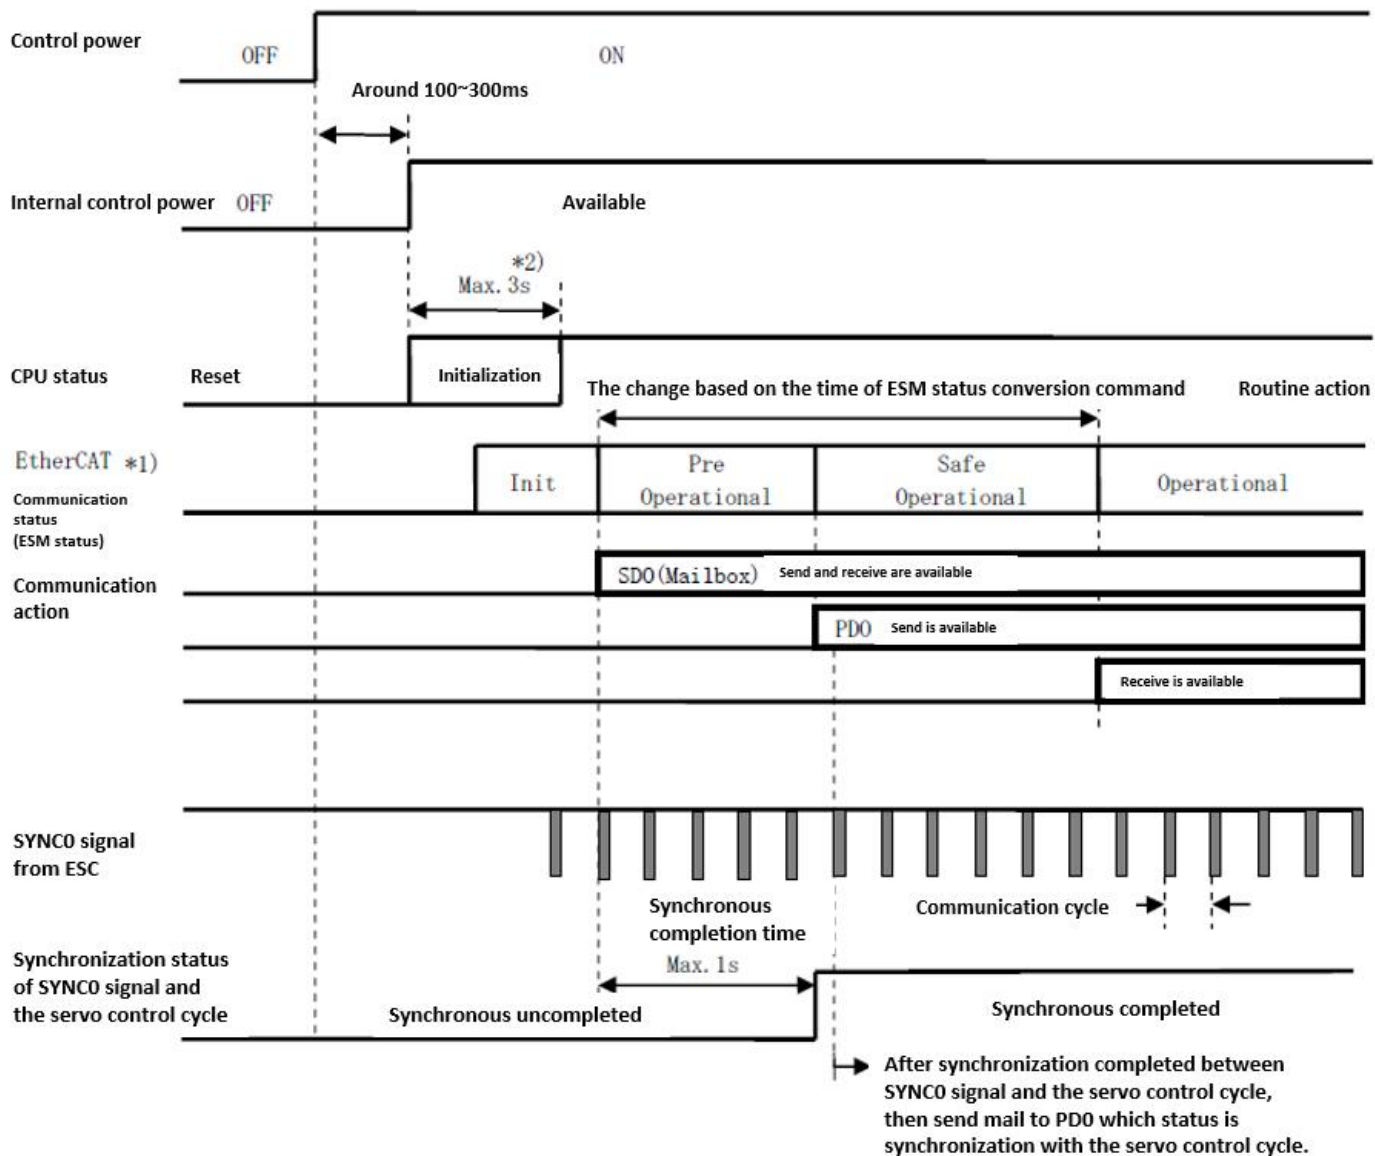

Synchronous mode	Content	Synchronization method	Feature
FreeRun	asynchronous	asynchronous	Simple processing Under real time
SM2	SM2 Synchronization of events	RxPDO receive event synchronization	No transmission delay compensation, poor accuracy Need to guarantee the transfer time in the upper computer (Dedicated hardware, etc.)
DC	SYNC0 Synchronization of events	Based on the time of the first axis Synchronize time information from other slaves	High precision Need to perform time compensation processing at the master station

### 3.5.1 DC synchronization

This servo driver has a 32 bit DC (Distributed Clock). The synchronization of EtherCAT communication is based on this DC. Synchronization is based on DC slaves that share the same reference clock (System Time). The local cycle of the slave starts at the SYNC0 event. Because the processing of the slave starts at SYNC0, it is always synchronized with the SYNC0 event. The master station needs to perform transmission delay compensation when the communication is initialized, as well as regular offset compensation.

The figure below shows the synchronization completion from the control power input to the SYNC0 event and the processing of the slave.

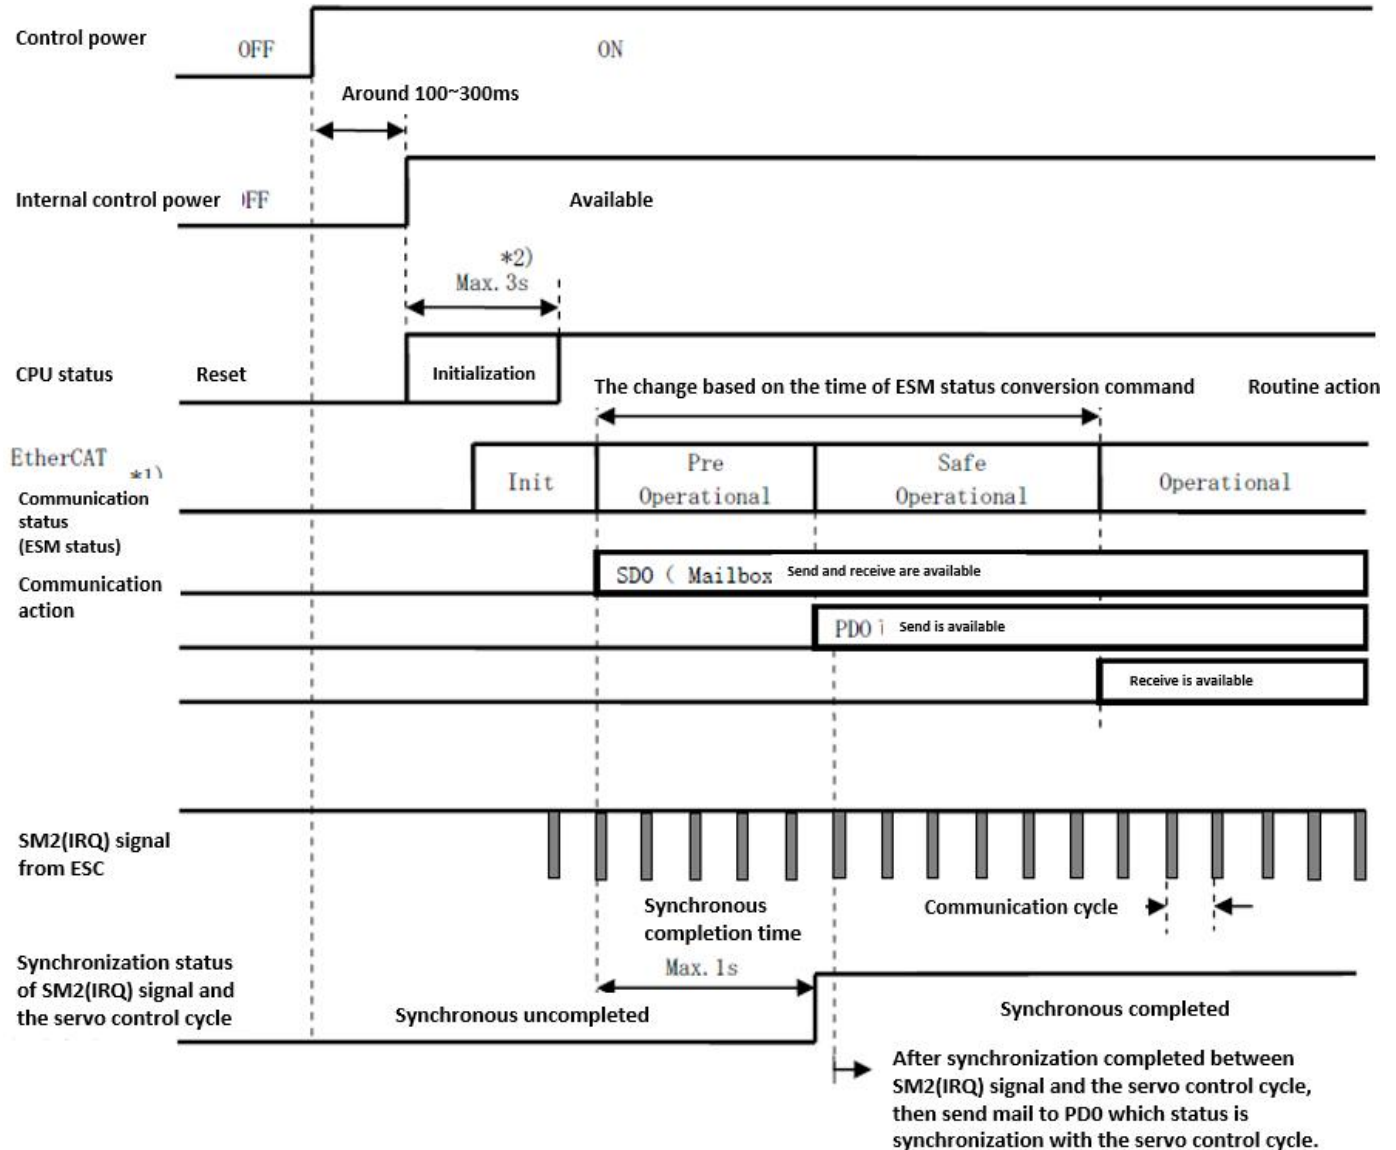

### 3.5.2 SM synchronization

The local cycle of the slave starts with the SM2 event. Since the processing of the slave starts with the SM2 event cycle, it is always synchronized with the SM2 event.

(Note): Because the SM2 event occurs when the PDO reception is completed, it must be ensured that the master station periodically transmits. If the sending event fluctuates too much, it can cause the synchronization to fail or an alarm occurs. If this happens, use DC synchronization.

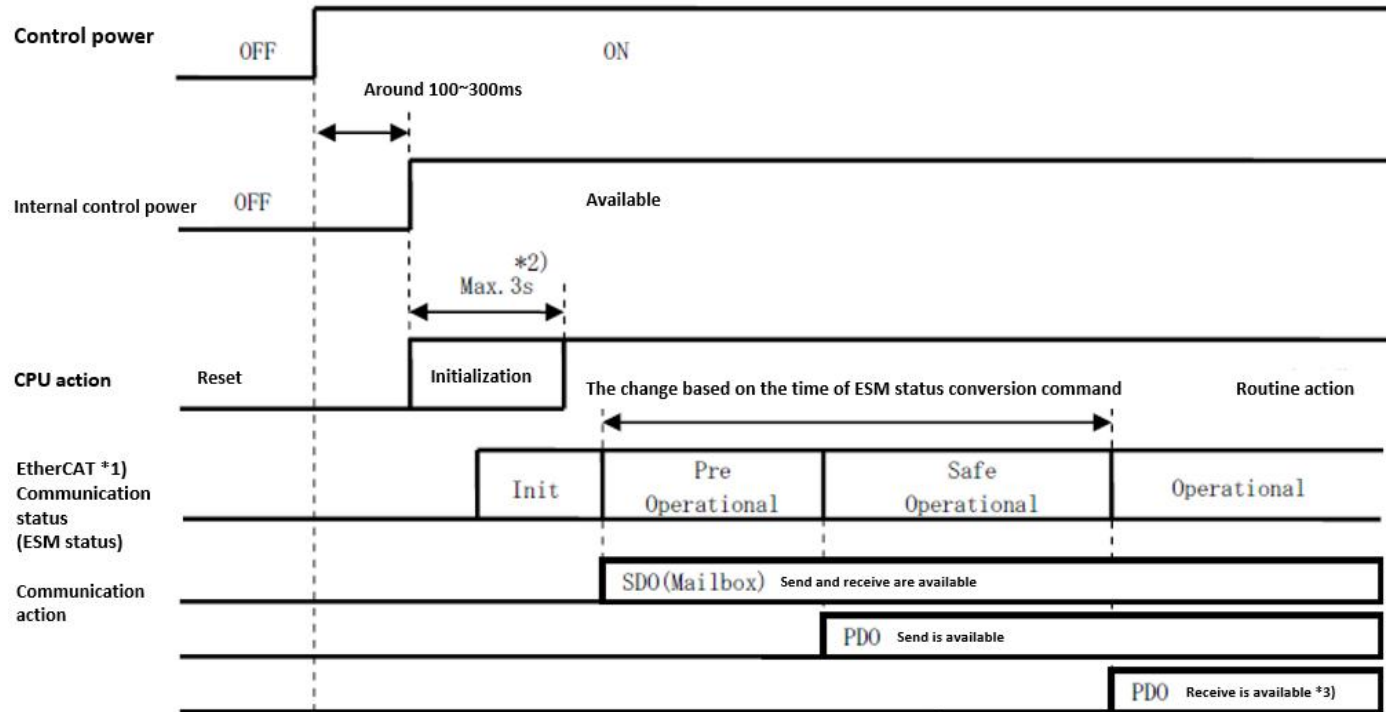

The figure below shows the synchronization completion from the control power input to the SM2 event and the processing of the slaves.

### 3.5.3 FreeRUN asynchronous

The FreeRUN mode starts with the disconnection of the slave's local timer. The local cycle is independent of the communication cycle or the master cycle and is asynchronous.

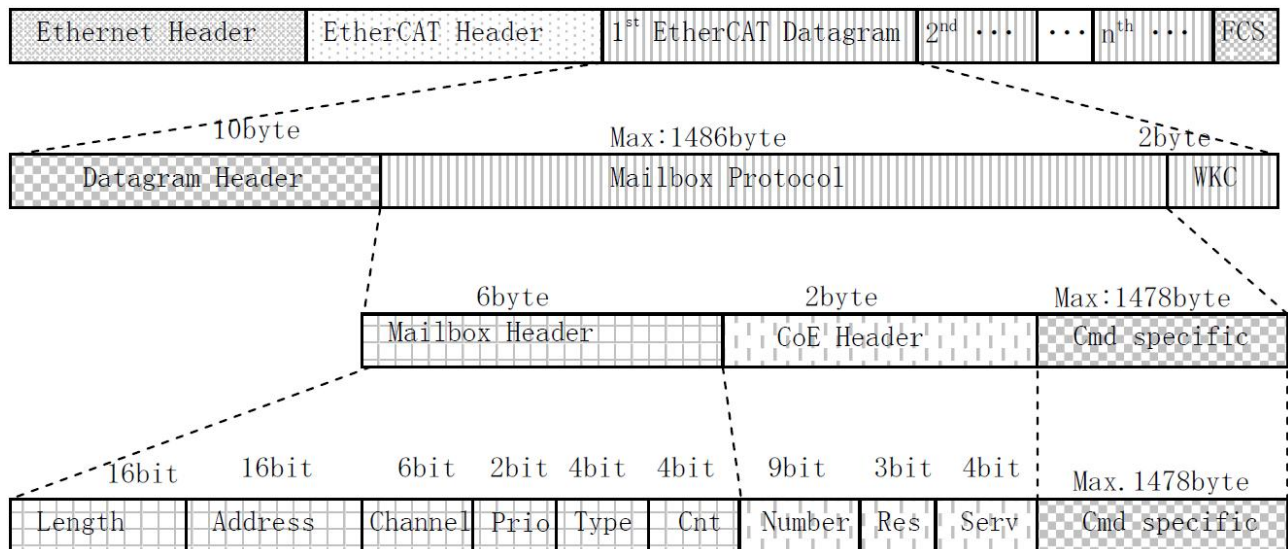

The figure below shows the process when controlling the power input.

### 3.6 SDO

SDO data exchange uses Mailbox communication. The master station reads and writes data in the records in the object dictionary, and can perform object setting and various status monitoring of slave stations.

#### 1) Mailbox data structure

Note: Please refer to the ETG specifications (ETG1000-5 and ETG1000-6) for details.

#### 2) Mailbox time out

This servo drive performs the following timeout settings in MailBox communication

- Mailbox request timeout: 100ms
- Mailbox response timeout: 10s

## 3.6.1 Information when an exception occurs

### 1) Abort message

If the SDO data exchange process fails, the slave returns the error code of the Abort message.

Error code F3 F2 F1 F0	Description
05 03 00 00 <sub>h</sub>	Toggle bit not alternated
05 04 00 01 <sub>h</sub>	Client / server command specifier not valid or unknown
06 01 00 00 <sub>h</sub>	Unsupported access to an object
06 01 00 01 <sub>h</sub>	Attempt to read a write only object
06 01 00 02 <sub>h</sub>	Attempt to write a read only object
06 02 00 00 <sub>h</sub>	Object does not exist in the object dictionary
06 04 00 41 <sub>h</sub>	Object cannot be mapped to the PDO
06 04 00 42 <sub>h</sub>	The number and length of the objects to be mapped would exceed PDO length
06 04 00 47 <sub>h</sub>	General internal incompatibility in the device
06 07 00 10 <sub>h</sub>	Data type does not match, length of service parameter does not match
06 07 00 12 <sub>h</sub>	Data type does not match, length of service parameter too high
06 07 00 13 <sub>h</sub>	Data type does not match, length of service parameter too low
06 09 00 11 <sub>h</sub>	Sub-index does not exist
06 04 00 43 <sub>h</sub>	General parameter incompatibility
06 06 00 00 <sub>h</sub>	Access failed due to an hardware error <sup>*1)</sup>
06 09 00 30 <sub>h</sub>	Value range of parameter exceeded
06 09 00 31 <sub>h</sub>	Value of parameter written too high
06 09 00 32 <sub>h</sub>	Value of parameter written too low
06 09 00 36 <sub>h</sub>	Maximum value is less than minimum value
08 00 00 20 <sub>h</sub>	Data cannot be transferred or stored to the application <sup>*1)</sup>
08 00 00 21 <sub>h</sub>	Data cannot be transferred or stored to the application because of local control
08 00 00 22 <sub>h</sub>	Data cannot be transferred or stored to the application because of the present device state <sup>*3)</sup>
08 00 00 23 <sub>h</sub>	No Object Dictionary is present <sup>*2)</sup>

### 2) Emergency message

The emergency message is transmitted from the slave station to the master station in response to the Mailbox communication when an abnormal alarm is sent in the servo driver.

Validity/invalidity of emergency message sending can be set to 10F3 (Diagnosis history) - 05h (Flags): bit0. It is enabled by default.

Index	SubIndex	Name	Unit	Range	Type	Access	PDO	OP-mode
10F3h	--	Diagnosis history	--	--	--	--	--	--
		The alarm history reading and the setting of Emergency message invalidation are executed.						
	05h	Flags	--	0 - 65535	U16	Follo wing table	No	ALL

		Bit 0	RW	0: Emergency message invalid		1: Emergency message effective		
		Bit4-1	R	Not supported, fixed to 0011b				
		Bit5	R	1: Clear the alarm history (10F3h-03h=0 write) is completed.				
		Bit15-6		Reserved				

Emergency message consists of 8 bytes of data, as shown in the following table:

Byte	0	1	2	3	4	5	6	7
content	Error code (OD: 603Fh) (L) (H)		Error register (OD: 1001h)	Error Field				

● Error code

Index	Sub Index	Name	Unit	Range	Type	Access	PDO	OP-mode
603Fh	00h	Error code	--	0-65535	U16	RO	TxPDO	ALL
		Indicates the servo driver's current alarm. FA**h ** indicates the main alarm number (00h - FFh) Example: FA10h : 10h Err10.0 Servo Drive Overcurrent Occurs FA03h : 03h Err03.0 Servo motor overload occurred Note: The b axis of the multi-axis servo driver is displayed as Fb**h						

● Error register

Index	Sub Index	Name	Unit	Range	Type	Access	PDO	OP-mode										
1001h	00h	Error register	--	0-255	U8	RO	NO	ALL										
		Indicates the type of current alarm of the servo driver. 00h is the alarm when the alarm does not occur. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>bit</th> <th>content</th> </tr> </thead> <tbody> <tr> <td>0-3</td> <td>(Not supported)</td> </tr> <tr> <td>4</td> <td>AL status code The defined alarm occurs (EtherCAT communication related alarms)</td> </tr> <tr> <td>5</td> <td>(Not supported)</td> </tr> <tr> <td>6</td> <td>(Reserved)</td> </tr> <tr> <td>7</td> <td>AL status code No defined alarm occurred (EtherCAT communication unrelated alarm)</td> </tr> </tbody> </table>							bit	content	0-3	(Not supported)	4	AL status code The defined alarm occurs (EtherCAT communication related alarms)	5	(Not supported)	6	(Reserved)
bit	content																	
0-3	(Not supported)																	
4	AL status code The defined alarm occurs (EtherCAT communication related alarms)																	
5	(Not supported)																	
6	(Reserved)																	
7	AL status code No defined alarm occurred (EtherCAT communication unrelated alarm)																	

● Error Field

The auxiliary number of the alarm returns Data[0] and 00h returns Data[1-4].

Example: A141 (instruction overspeed) occurs when single-axis servo or dual-axis A-axis occurs

Byte	0	1	2	3	4	5	6	7
content	Error code		Error register	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]
value	FA14h		80h	01h	00h	00h	00h	00h

F\_\_ Main alarm  
number

Sub alarm number

Example: When b141 (command overspeed) is sent on the biaxial b-axis

Byte	0	1	2	3	4	5	6	7
content	Error code		Error register	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]
value	Fb14h		80h	01h	00h	00h	00h	00h

F\_ \_ \_ Main alarm  
number

Sub alarm number

When the abnormal state is cleared in the servo driver

Byte	0	1	2	3	4	5	6	7
content	Error code		Error register	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]
value	0000h		00h	00h	00h	00h	00h	00h

### 3.7 PDO

For EtherCAT real-time data transfer, it executes through PDO data exchange

The PDO has the RxPDO transfer from the master station to slave station and the TxPDO transfer from the slave station to master station.

	Sender	Receiver
RxPDO	Master	Slave
TxPDO	Slave	Master

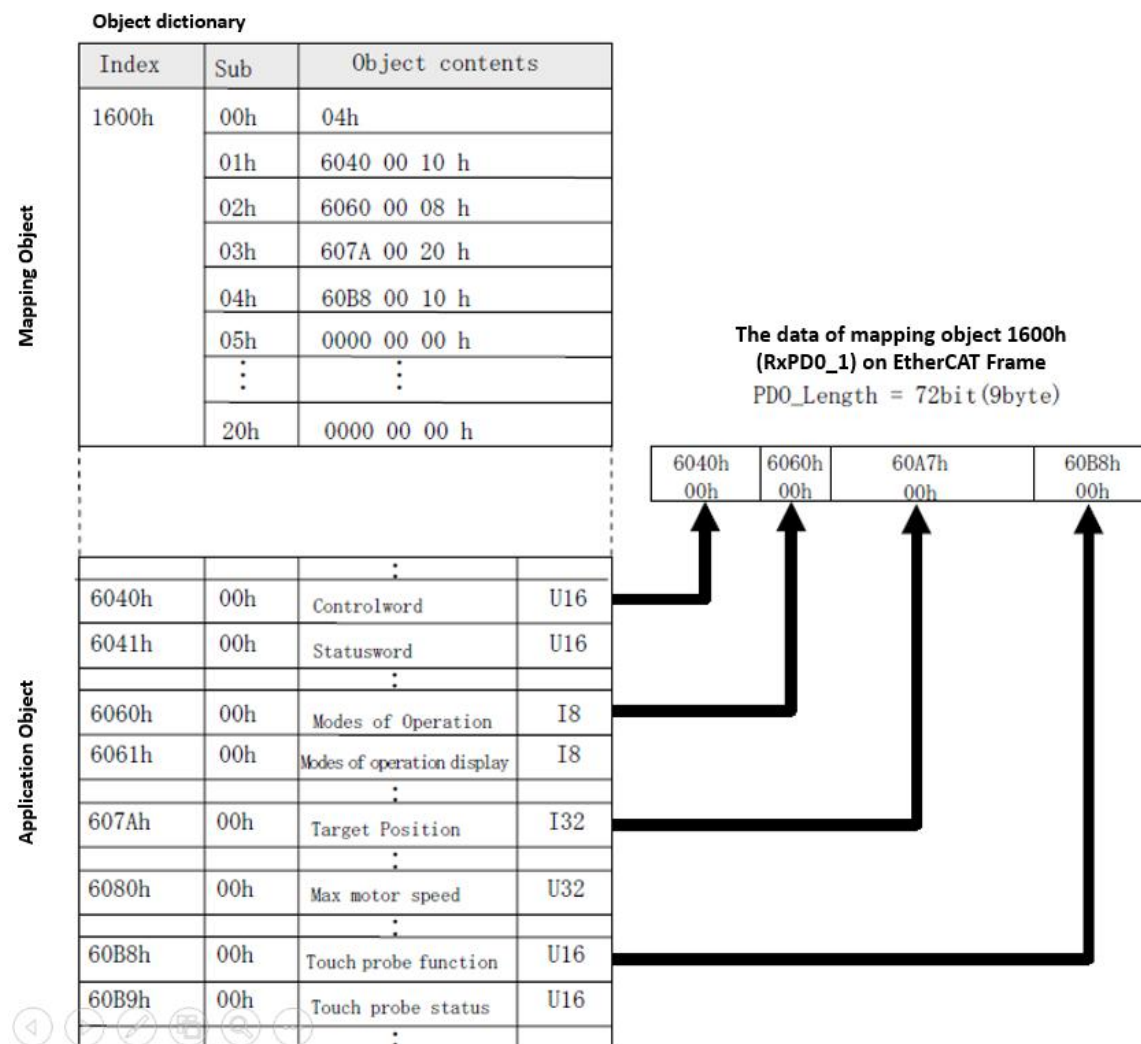

#### 3.7.1 PDO mapping object

The PDO mapping refers to the mapping of the application objects from the object dictionary to the PDO.

RxPDO can use 1600h - 1603h and TxPDO to define PDO mapping objects using 1A00h - 1A03h.

The maximum number of application objects that a mapping object can define for RxPDO/TxPDO is 32bytes.

Example: an example of allocating application objects 6040h, 6060h, 60B8h to mapping object 1600h (RxPDO\_1).

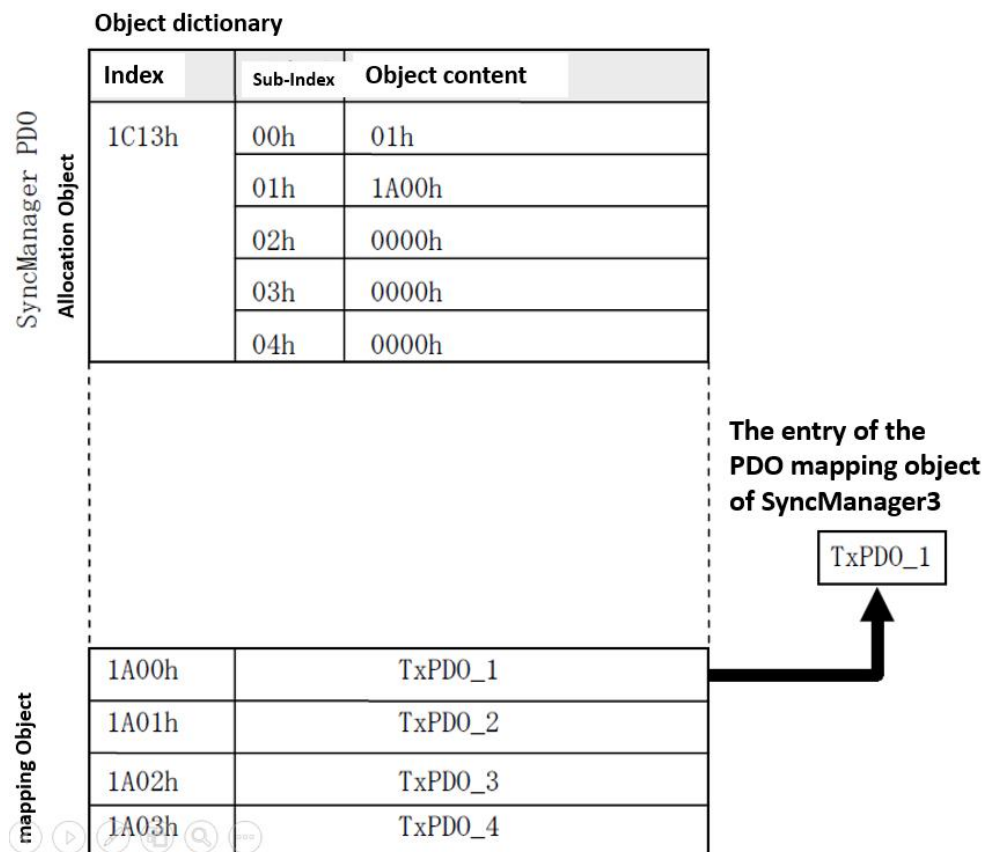

### 3.7.2 PDO allocation object

Because of the PDO data exchange, you must assign the PDO mapping table to SyncManager. Allocate object for the SyncManager PDO record the relationship between the table and SyncManager for mapping.

This servo product's SyncManager PDO allocation object can use RxPDO (SyncManager2) 1C12h, TxPDO (SyncManager3) 1C13h.

The maximum number of application objects that can be defined by an allocation object by RxPDO/TxPDO is 4 Table. Usually, because the mapping object is sufficient, the default does not need to be changed.

Example: an example of allocating mapping object 1A00h, 6060h, 60B8h to mapping object 1600h (RxPDO\_1).

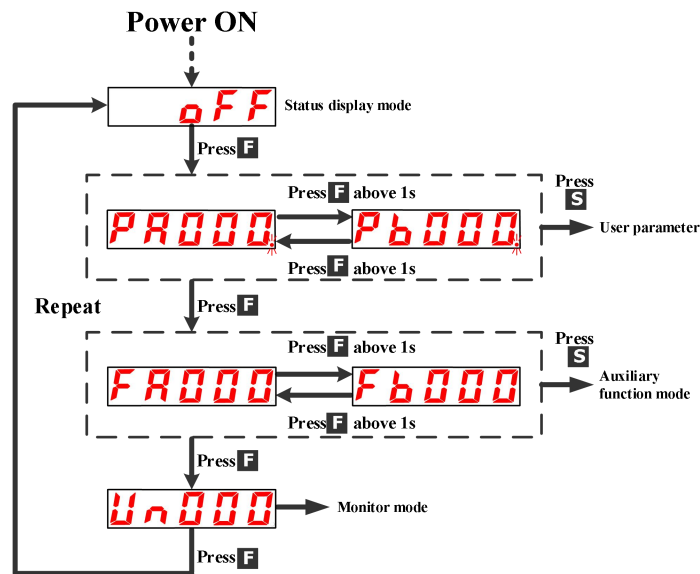

### 3.8 Front panel structure & Node Address setting

The front panel is used to switch between A and B axis display & operations, Parameters settings, Jog operation and other status display etc.

#### 3.8.1 Basic mode selection & operation

The servo drive basic mode switch, operation, status display, parameters setting, operation command operation are executed by pressing the front panel. The basic mode include status display mode, parameter setting mode, monitoring mode along with auxiliary function mode. By pressing F key, each mode will be switched by the following chart.

## 3.8.2 Status display mode & EtherCAT Indicators

1) The data display of each bit.

This servo drive provides 4 EtherCAT indicators through 7 display tubes. Please refer to the right drawing:

①(L/A IN)、⑤(L/A OUT)、

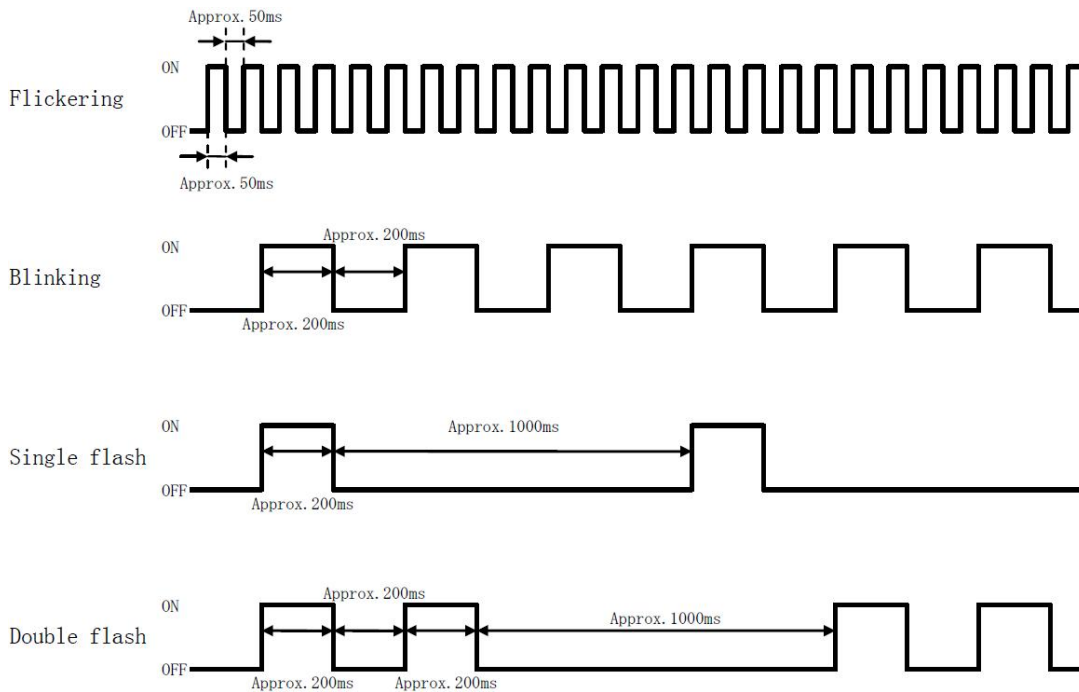

⑥(A axis RUN)、⑪(b axis RUN)。

Item	Speed ,Torque control mode		Position control mode	
	Bit data	Display content	Bit data	Display content
①	L/A IN	Physical layer connection status & operation status from the input port	L/A IN	Physical layer connection status & operation status from the input port
②	A Axis Same speed (/V-CMP)	When the difference between motor speed & command speed is lower than the defined value, it lights on. Define value parameter: PA503 ( factory set value is 10rpm )	A axis Orientation complete (/COIN)	When the bias between actual motor position is smaller than the position command, it lights on. Define value parameter: PA500 ( factory set value is 10 pulses )
③	A Axis Motor torque output	The motor output torque reaches 10% of the rated torque.	A axis Motor torque output	The motor output torque reaches 10% of the rated torque.
④	A axis CW/CCW prohibited	When the servo is under the position limit status: If the light is on, it means CCW is prohibited. The light off, it means CW is prohibited. Blinking means CW/CCW both prohibited.	A axis CW/CCW prohibited	When the servo is under the position limit status: If the light is on, it means CCW is prohibited. The light off, it means CW is prohibited. Blinking means CW/CCW both prohibited.
⑤	L/A IN	Physical layer connection status & operation status from the output port	L/A IN	Physical layer connection status & operation status from the output port
⑥	B axis Same speed (/V-CMP)	When the difference between motor speed & command speed is lower than the defined value, it lights on. Define value parameter: Pb503 ( Factory set value is 10rpm )	B axis Orientation completed (/COIN))	When the bias between actual motor position is smaller than the position command, it lights on. Define value parameter: PA500 ( factory set value is 10 pulse )
⑦	B axis Motor torque output	The motor output torque reaches 10% of the rated torque.	B axis Motor torque output	The motor output torque reaches 10% of the rated torque.
⑧	B axis CW/CCW prohibited	When the servo is under the position limit status: If the light is on, it means CCW is prohibited. The light off, it means CW is prohibited. Blinking means CW/CCW both	B axis CW/CCW prohibited	When the servo is under the position limit status: If the light is on, it means CCW is prohibited. The light off, it means CW is prohibited. Blinking means CW/CCW both

		prohibited.		prohibited.
⑨	Main power supply ready	The light is on if the main power supply is normal. The light is off if the main power is being cut off.	Main power supply ready	The light is on if the main power supply is normal. The light is off if the main power is being cut off.
⑩	A axis RUN Indicator	ESM status	A Axis RUN Indicator	ESM status
⑪	B axis RUN Indicator	ESM status	B axis RUN Indicator	ESM status

## 2) EtherCAT Indicators

As LED status, ON & OFF have the following 4 modes:

### a) RUN operation

RUN Indicator indicates the ESM status

LED status	Descriptions
OFF	ESM: initialized state
Blinking	ESM: Pre-Operational status
Single flash	ESM: Safe-Operational status
ON	ESM: Operational status

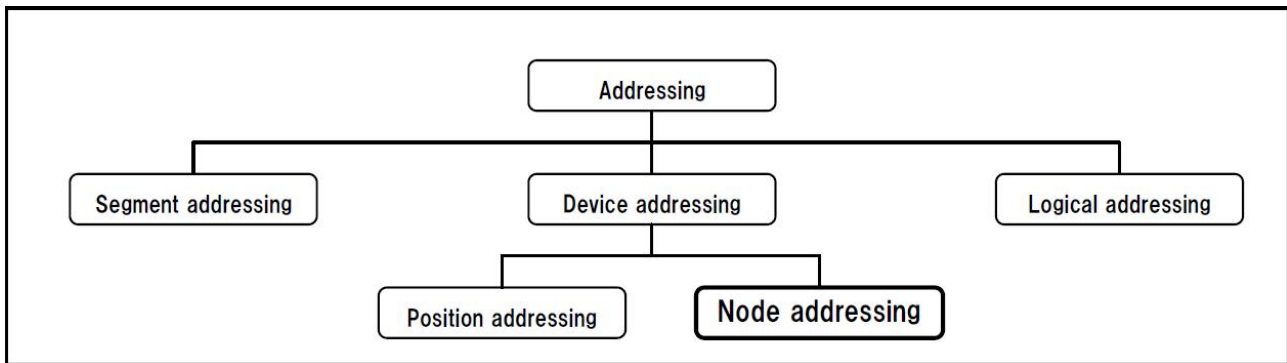

### b) L/A IN & L/A OUT

L/A IN & L/A OUT indicate the connection status and operation conditions of each physical port.

LED status	Descriptions
OFF	Unable to connect
Blinking	Connected and with data receiving and sending
ON	Connected but no data transferring

### 3.8.3 Node addressing (Station alias setting)

The specified addressing mode of EtherCAT:

This chapter will have introduction of Node addressing. There are 3 ways to differentiate the servo drive according to the setting methods and read methods, the main station fixed the ID of slave station .

1) Read SII value through “Configured Station Alias”

The method of reading SII 0004h value through 0012h (Configured Station Alias on ESC register.

2) Read parameter PA013 values through “Configured Station Alias”

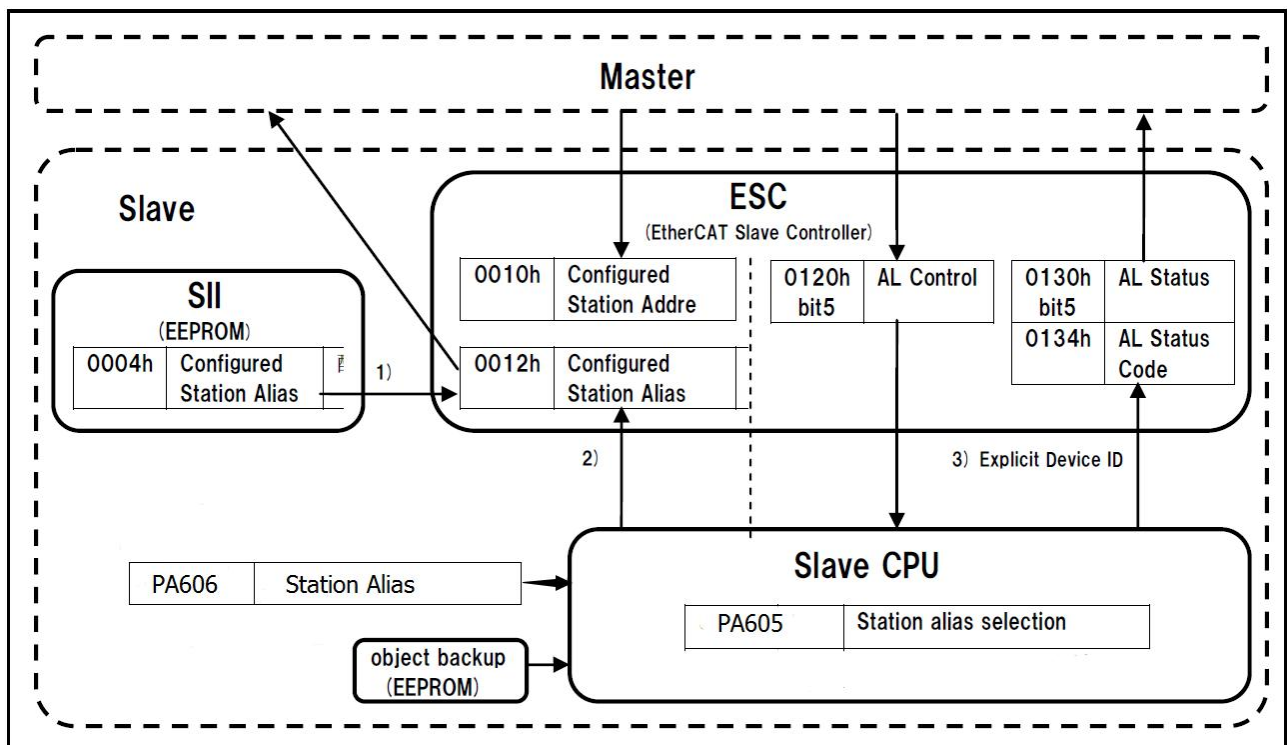

The method of reading parameter PA013 values through 0012h (Configured Station Alias) on ESC register 从 ESC

3) Read PA013 values through “AL Status Code”

The method of reading P6606 set value through application level status code (0134h).

Main station reads the set value of ESC register Configured Station Alias(0012h), and then set to Configured Station Address(0010h).

Based on the above, set the FPRD command addresses while use mailbox settings.

1) Read Configured Station Alias through SII value

The servo drive reads PA014 value through backup EEPROM when its powered on, if the value is 1, set the 0004h (Configured Station Alias) value of SII into 0012h of ESC register. Please read this value from the main station.

2) Read Configured Station Alias through PA013 value

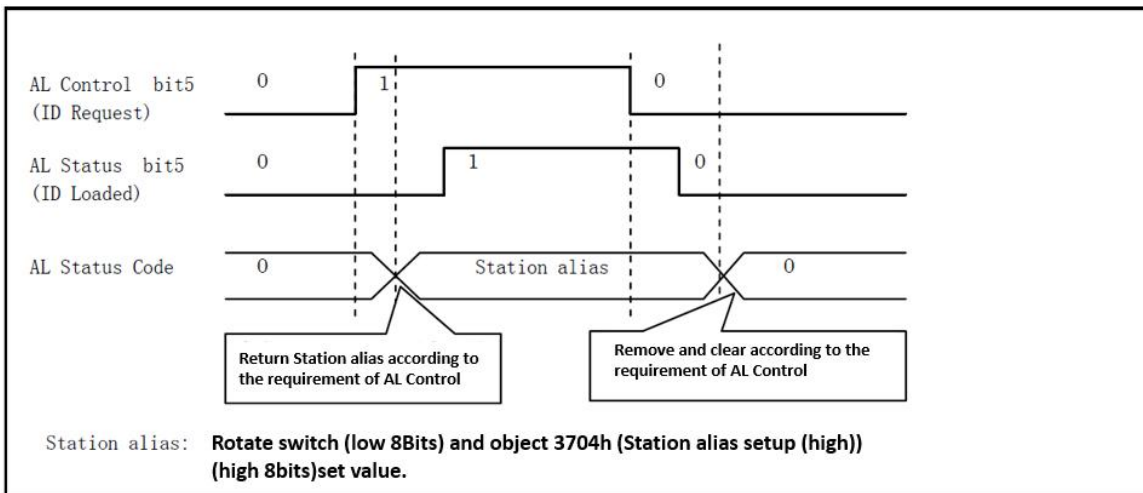

The servo drive reads PA014 value through backup EEPROM when its powered on, if the value is 0, set PA013 value to

0012h (Configured Station Alias) of ESC register. Please read this value from the main station.

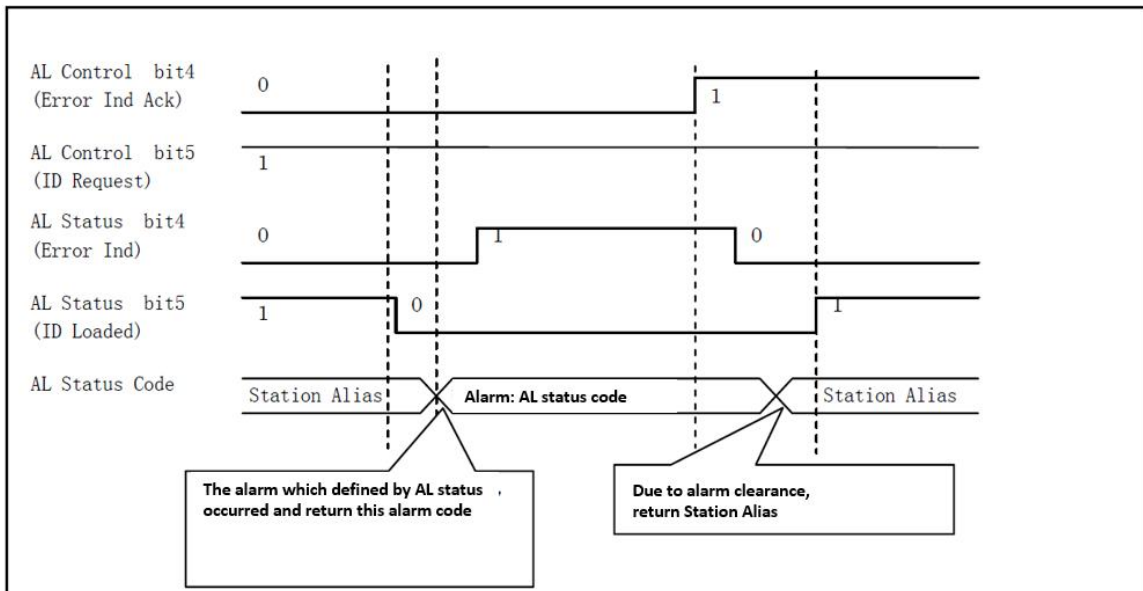

PA number	Name	Range	Unit	Default	Power restart	Remarks
PA014	EtherCAT Station alias selection	0 ~ 1	—	0000	Y	This parameter is invalid for b axis
	0: use the value of PA013 as the EtherCAT Station alias. 1: use the SII zone(0004h) value as the EtherCAT Station alias.					
PA013	EtherCAT Station alias	0000 ~ FFFF	—	0001	Y	This parameter is invalid for b axis

3) Read “AL Status Code” through PA013 value:

- The bit5(ID Request) of “AL Control(0120h) “ is 1
- Return to “AL Status Code(0134h)” based on parameters PA013 & PA014.
- The bit5(ID login) of “AL Status (0130h)” return to 1.
- The bit5(ID request)of “AL Control (0120h)” return to 0.
- The bit5(ID login) of “AL Status (0130h)” return to 0.
- AL Status Code(0134h) is being cleared.

In addition, during the return process of Station Alias, if alarm(defined by AL Status Code) occurs, then it return to the related AL Status Code. It will return back to Stations Alias if the alarm is cleared.

# 4、 General specification for objects

## 4.1 Object structure

Object dictionary table for CoE (CANopen over EtherCAT) by CiA402 protocol

Specified object dictionary of CiA402		Object dictionary of ES-**A30		
Index	content	Index	content	reference

		Indicate the device information													
	00h	Numer of entries	--	0 - 255	U8	RO	No	ALL							
		The default number is the Subindex value, fixed value is 04h													
	01h	Vendor ID	--	00000088	U32	RO	No	ALL							
		Indicate the EtherCAT Vendor ID													
	02h	Product code	--	0 - 4294967295	U32	RO	No	ALL							
		Indicate product code Single axis    0x00010000                      Multi axis    0x00020000													
	03h	Revision number	--	0 - 4294967295	U32	RO	No	ALL							
04h	Serial number	--	0 - 4294967295	U32	RO	No	ALL								

## 5.3 SM communication type (1C00h)

The SM action mode is set through 1C00h object, as for servo drive, this value is fixed.

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode
1C00h	--	SM communication type	--	--	--	--	--	--
		Set SM action mode						
	00h	Numer of entries	--	0 - 255	U8	RO	No	ALL
		Indicate Subindex numbers, fixed value is 04h						
	01h	Communication type SM0	--	0 - 4	U8	RO	No	ALL
		Set SM0 usage: 0: not used 1: mail receiving (master station->slave station)      3: RxPDO(master station->slave station) 2: mail sending (slave station->master station)      4: TxPDO(slave station->master station) SM0 uses Mailbox to receive mail, so the fixed value is 1.						
	02h	Communication type SM1	--	0 - 4	U8	RO	No	ALL
		Set SM1 usage: 0: not used 1: mail receiving (master station->slave station)      3: RxPDO(master station->slave station) 2: mail sending (slave station->master station)      4: TxPDO(slave station->master station) SM0 uses Mailbox to receive mail, so the fixed value is 2.						
	03h	Communication type SM2	--	0 - 4	U8	RO	No	ALL
		Set SM2 usage: 0: not used 1: mail receiving (master station->slave station)      3: RxPDO(master station->slave station) 2: mail sending (slave station->master station)      4: TxPDO(slave station->master station) SM2 uses Process data output (RxPDO), so the fixed value is 3.						
	04h	Communication type SM3	--	0 - 4	U8	RO	No	ALL
		Set SM3 usage: 0: not used 1: mail receiving (master station->slave station)      3: RxPDO(master station->slave station) 2: mail sending (slave station->master station)      4: TxPDO(slave station->master station) SM3 uses Process data in(TxPDO), so the fixed value is 4						

## 5.4 PDO mapping

### 5.4.1 PDO allocating object

PDO mapping allocation table: SM sets the objects through 1C12-1C13h

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode
1C12h	--	SM2	--	--	--	--	--	--
	--	Set the entrance of PDO mapping object on SM2 SM2 used as Process data output(RxPDO) This object can be changed only when ESM status is PreOP Note) if Subindex00h value is not 0, 01h-04h cant be changed.						
	00h	Numer of entries	--	0 - 4	U8	RW	No	ALL
		Indicate the number of allocated objects						
	01h	Mapping OD index of RxPDO1	--	1600h – 1603h 1610h – 1613h	U16	RW	No	ALL
		Appoint the PDO mapping object.						
	02h	Mapping OD index of RxPDO2	--	1600h – 1603h 1610h – 1613h	U16	RW	No	ALL
		Appoint the PDO mapping object.						
	03h	Mapping OD index of RxPDO3	--	1600h – 1603h 1610h – 1613h	U16	RW	No	ALL
		Appoint the PDO mapping object.						
04h	Mapping OD index of RxPDO4	--	1600h – 1603h 1610h – 1613h	U16	RW	No	ALL	
	Appoint the PDO mapping object.							
1C13h	--	SM3	--	--	--	--	--	--
	--	Set the entrance of PDO mapping object on SM3. SM3 used as Process data output(TxPDO). This object can be changed only when ESM status is PreOP Noted: if Subindex00h value is not 0, 01h-04h cant be changed.						
	00h	Numer of entries	--	0 - 4	U8	RW	No	ALL
		Indicate the number of allocated objects						
	01h	Mapping OD index of RxPDO1	--	1600h – 1603h 1610h – 1613h	U16	RW	No	ALL
		Appoint the PDO mapping object.						
	02h	Mapping OD index of RxPDO2	--	1600h – 1603h 1610h – 1613h	U16	RW	No	ALL
		Appoint the PDO mapping object.						
	03h	Mapping OD index of RxPDO3	--	1600h – 1603h 1610h – 1613h	U16	RW	No	ALL
		Appoint the PDO mapping object.						
04h	Mapping OD index of RxPDO4	--	1600h – 1603h 1610h – 1613h	U16	RW	No	ALL	
	Appoint the PDO mapping object.							

Note: subindex01-04h of 1C12h and 1C13h can be changed only when the ESM status is PreOP and Subindex00h=0. The other state is return to Abort Code (0601 0003h).After setting the change, set the Subindex number of Subindex00h ,

reflect the PDO allocation object setting by converting ESM status to SafeOP.

## 5.4.2 PDO mapping object

PDO mapping object table : RxPDO uses 1600h~1603h(multi axis drive b axis uses 1610h~1613h)、TxPDO uses 1A00h~1A03h(multi axis drive b axis uses 1A10h~1A13h)

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode
1600h / 1610h	--	RxPDO mapping 1	--	--	--	--	--	--
		Indicate RxPDO object The value of this object can only be changed when ESM status is PreOP Note: if Subindex00h value is not 0, then 01h-20h cant be changed						
	00h	Numer of entries	--	0 - 32	U8	RW	No	ALL
		Indicate the number of allocations of this object						
	01h	1 <sup>st</sup> receive PDO mapped	--	0 - 4294967295	U32	RW	No	ALL
		Set the first mapping object						
		bit31 : bit16		bit15 : bit8		bit07 : bit00		
	Index		SubIndex		Bit length			
	02h	2 <sup>nd</sup> receive PDO mapped	--	0 - 4294967295	U32	RW	No	ALL
		Set the first mapping object, method is same as Subindex01.						
03h	3 <sup>rd</sup> receive PDO mapped	--	0 - 4294967295	U32	RW	No	ALL	
	Set the 2nd mapping object, method is same as Subindex01.							
:	:							
20h	32 <sup>nd</sup> receive PDO mapped	--	0 - 4294967295	U32	RW	No	ALL	
	Set the 32 <sup>nd</sup> mapping object, method is same as Subindex01.							
1601h / 1611h	--	RxPDO mapping 2	--	--	--	--	--	--
		Subindex & other specs are the same as 1600h						
1602h / 1612h	--	RxPDO mapping 3	--	--	--	--	--	--
		Subindex & other specs are the same as 1600h						
1603h / 1613h	--	RxPDO mapping 4	--	--	--	--	--	--
		Subindex & other specs are the same as 1600h						

Note: please don't map the same object

The subindex01-04h of 1600h -- 1610h(multi-axis drive b 1610h~1613h) can be changed only when the ESM state is PreOP and Subindex00h=0. The other state is to return to Abort Code (0601 0003h).After setting the change, set the Subindex number of Subindex 00h , reflect the PDO allocation object setting by converting ESM status to SafeOP.

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode
1A00h / 1A10h	--	TxPDO mapping 1	--	--	--	--	--	--
		Indicate TxPDO object The value of this object can only be changed when ESM status is PreOP Note: if Subindex00h value is not 0, then 01h-20h cant be changed						
	00h	Numer of entries	--	0 - 32	U8	RW	No	ALL
		Indicate the number of allocations of this object						
	01h	1 <sup>st</sup> transmit PDO mapped	--	0 - 4294967295	U32	RW	No	ALL
		Set the first mapping object						
		bit31 : bit16		bit15 : bit8		bit07 : bit00		
		Index		SubIndex		Bit length		
	02h	2 <sup>nd</sup> transmit PDO mapped	--	0 - 4294967295	U32	RW	No	ALL
		Set the first mapping object, the method is the same as Subindex01.						
	03h	3 <sup>rd</sup> transmit PDO mapped	--	0 - 4294967295	U32	RW	No	ALL
		Set the second mapping object, the method is the same as Subindex01.						
:	:							
20h	32 <sup>nd</sup> transmit PDO mapped	--	0 - 4294967295	U32	RW	No	ALL	
	Set the 32 <sup>nd</sup> apping object, the method is the same as Subindex01.							
1A01h / 1A11h	--	TxPDO mapping 2	--	--	--	--	--	--
		Subindex & other specs are the same as 1600h						
1A02h / 1A12h	--	TxPDO mapping 3	--	--	--	--	--	--
		Subindex & other specs are the same as 1600h						
1A03h / 1A13h	--	TxPDO mapping 4	--	--	--	--	--	--
		Subindex & other specs are the same as 1600h						

Note: please don't map the same object

The subindex01-04h of 1A00h - 1A10h (multi-axis drive b axis 1A10h~1A613h) can be changed only when the ESM state is PreOP and Subindex00h=0. The other state is to return to Abort Code (0601 0003h). After setting the changes, set the Subindex number of Subindex00h, reflect the PDO allocation object setting by converting ESM status to SafeOP.

## 5.4.3 Default PDO mapping

- PDO mapping 1

Position control (Touch probe)

	Index	Sub-Index	Size (bit)	Name	Factory default
RxPDO (1600h)	6040h	00h	16	Controlword	60400010h
	6060h	00h	8	Modes of operation	60600008h
	607Ah	00h	32	Target Position	607A0020h
	60B8h	00h	16	Touch probe function	60B80010h
TxPDO (1A00h)	603Fh	00h	16	Error code	603F0010h
	6041h	00h	16	Statusword	60410010h
	6061h	00h	8	Modes of operation display	60610008h
	6064h	00h	32	Position actual value	60640020h
	60B9h	00h	16	Touch probe status	60B90010h
	60BAh	00h	32	Touch probe pos1 pos value	60BA0020h
	60F4h	00h	32	Following error actual value	60F40020h
	60FDh	00h	32	Digital inputs	60FD0020h

- PDO mapping 2

Position mode, speed mode, torque mode (Touch probe)

	Index	Sub-Index	Size (bit)	Name	Factory default
RxPDO (1601h)	6040h	00h	16	Controlword	60400010h
	6060h	00h	8	Modes of operation	60600008h
	6071h	00h	16	Target Torque	60710010h
	607Ah	00h	32	Target Position	607A0020h
	6080h	00h	32	Max motor speed	60800020h
	60B8h	00h	16	Touch probe function	60B80010h
	60FFh	00h	32	Target Velocity	60FF0020h
TxPDO (1A01h)	603Fh	00h	16	Error code	603F0010h
	6041h	00h	16	Statusword	60410010h
	6061h	00h	8	Modes of operation display	60610008h
	6064h	00h	32	Position actual value	60640020h
	606Ch	00h	32	Velocity actual value	606C0020h
	6077h	00h	16	Torque actual value	60770010h
	60B9h	00h	16	Touch probe status	60B90010h
	60BAh	00h	32	Touch probe pos1 pos value	60BA0020h
	60FDh	00h	32	Digital inputs	60FD0020h

- The PDO mapping 3

Position mode, speed mode (use of Touch probe, torque limitation)

	Index	Sub-Index	Size (bit)	Name	Factory default
RxPDO (1602h)	6040h	00h	16	Controlword	60400010h
	6060h	00h	8	Modes of operation	60600008h
	6072h	00h	16	Max torque	60720010h
	607Ah	00h	32	Target Position	607A0020h
	60B8h	00h	16	Touch probe function	60B80010h
	60FFh	00h	32	Target Velocity	60FF0020h
TxPDO (1A02h)	603Fh	00h	16	Error code	603F0010h
	6041h	00h	16	Statusword	60410010h
	6061h	00h	8	Modes of operation display	60610008h
	6064h	00h	32	Position actual value	60640020h
	606Ch	00h	32	Velocity actual value	606C0020h
	6077h	00h	16	Torque actual value	60770010h
	60B9h	00h	16	Touch probe status	60B90010h
	60BAh	00h	32	Touch probe pos1 pos value	60BA0020h
	60FDh	00h	32	Digital inputs	60FD0020h

- The PDO mapping 4

Position mode, speed mode, torque mode (use of Touch probe, torque limitation)

	Index	Sub-Index	Size (bit)	Name	Factory default
RxPDO (1603h)	6040h	00h	16	Controlword	60400010h
	6060h	00h	8	Modes of operation	60600008h
	6071h	00h	16	Target Torque	60710010h
	6072h	00h	16	Max torque	60720010h
	607Ah	00h	32	Target Position	607A0020h
	6080h	00h	32	Max motor speed	60800020h
	60B8h	00h	16	Touch probe function	60B80010h
	60FFh	00h	32	Target Velocity	60FF0020h
TxPDO (1A03h)	603Fh	00h	16	Error code	603F0010h
	6041h	00h	16	Statusword	60410010h
	6061h	00h	8	Modes of operation display	60610008h
	6064h	00h	32	Position actual value	60640020h
	606Ch	00h	32	Velocity actual value	606C0020h
	6077h	00h	16	Torque actual value	60770010h
	60B9h	00h	16	Touch probe status	60B90010h
	60BAh	00h	32	Touch probe pos1 pos value	60BA0020h
60FDh	00h	32	Digital inputs	60FD0020h	

## 5.4.4 PDO mapping setup steps

In order to increase the Profile speed to 1600h(RxPDO mapping 1), the setting steps of PDO mapping are described.

Before the change

Index	Set Value	Object content	
1600h-01h	60400010h	6040h-00h	Controlword
1600h-02h	60600008h	6060h-00h	Modes of operation
1600h-03h	607A0020h	607Ah-00h	Target Position
1600h-04h	60B80010h	60B8h-00h	Touch probe function

After the change

Index	Set Value	Object content	
1600h-01h	60400010h	6040h-00h	Controlword
1600h-02h	60600008h	6060h-00h	Modes of operation
1600h-03h	607A0020h	607Ah-00h	Target Position
1600h-04h	60B80010h	60B8h-00h	Touch probe function
1600h-05h	60810020h	6081h-00h	Profile velocity

← Increase

<Setting method> When using SDO information setting

- 1) Switch the ESM status from Iniiit to PreOP.
- 2) The value of 1600h-00h is modified by SDO to 0.
- 3) The value of 1600h-05h modified by SDO is 60810020h.
- 4) The value of 1600h-00h is modified by SDO.
- 5) Switch the ESM status from PreOP to SafeOP. TxPDO is effective.
- 6) Switch the ESM status from SafeOP to OP and RxPDO is effective.
- 7) If the power is turned off again, 2 - 4 need to be set.

## 5.5 SM2/3 synchronization(1C32、 1C33h)

SM2 is executed by setting 1C32h, and SM3 is executed by setting 1C33h.

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode	
1C32h	--	SM2 synchronization	--	--	--	--	--	--	
	00h	Numer of entries	--	0 - 255	U8	RW	No	ALL	
		Represents the number of objects allocated to this object.							
	01h	Sync mode	--	0 - 65535	U16	RW	No	ALL	
		Set the synchronous mode for SM2.							
		00h:FreeRun(not synchronized)				01h: SM2(synchronized with sm2 event)			
		02h:DCSYNC0(synchronized with sync0)				03h:			
		According to the combination of the settings of ESC register 0981h (DC-Activation) (table below), the set value of this object is automatically set when switching from PreOP to SafeOP.							
		ESC register 0981h Setting state	1C32h-01h setting value			The value of 1c32h-01h changed when the PreOP->SafeOP is switched.			
		DC effective ON	00h: FreeRun		->	02h: DC SYNC0

20h	Sync error		0 - 1	bool	RO	No	ALL	Not supported

Note: this table only provides reference value, not to ensure content.

## 5.5.1 DC (SYNC0 Event synchronization)

Synchronization method	feature
Based on the time of the first axis	High precision
Synchronize time information from other slaves	It is necessary to compensate at the main station side.

The specifications of DC synchronous mode in this servo driver are as follows:

SM2/3 setting in DC sync mode:

Index	Sub-Index	Access	Name	Value
1C32h	00h	RO	Numer of entries	20h
	01h	RW	Sync mode	02h
	02h	RW	Cycle time	100us: 100000    200us: 200000    500us: 500000 1ms: 1000000    2ms: 2000000    4ms: 4000000
	03h	RO	Shift time	Not supported
	04h	RO	Sync modes supported	00100b
	05h	RO	Min cycle time	17000
	06h	RO	Calc and copy time	100000
	09h	RO	Delay time	0
	0Ah	RO	Sync0 cycle time	The value of ESC register 09A0h
	0Bh	RO	Cycle time too small	Not supported
	0Ch	RO	SM-event missed	Not supported
	0Dh	RO	Shift time too short	Not supported
	20h	RO	Sync error	Not supported

Note: this table only provides reference value, not to ensure content.

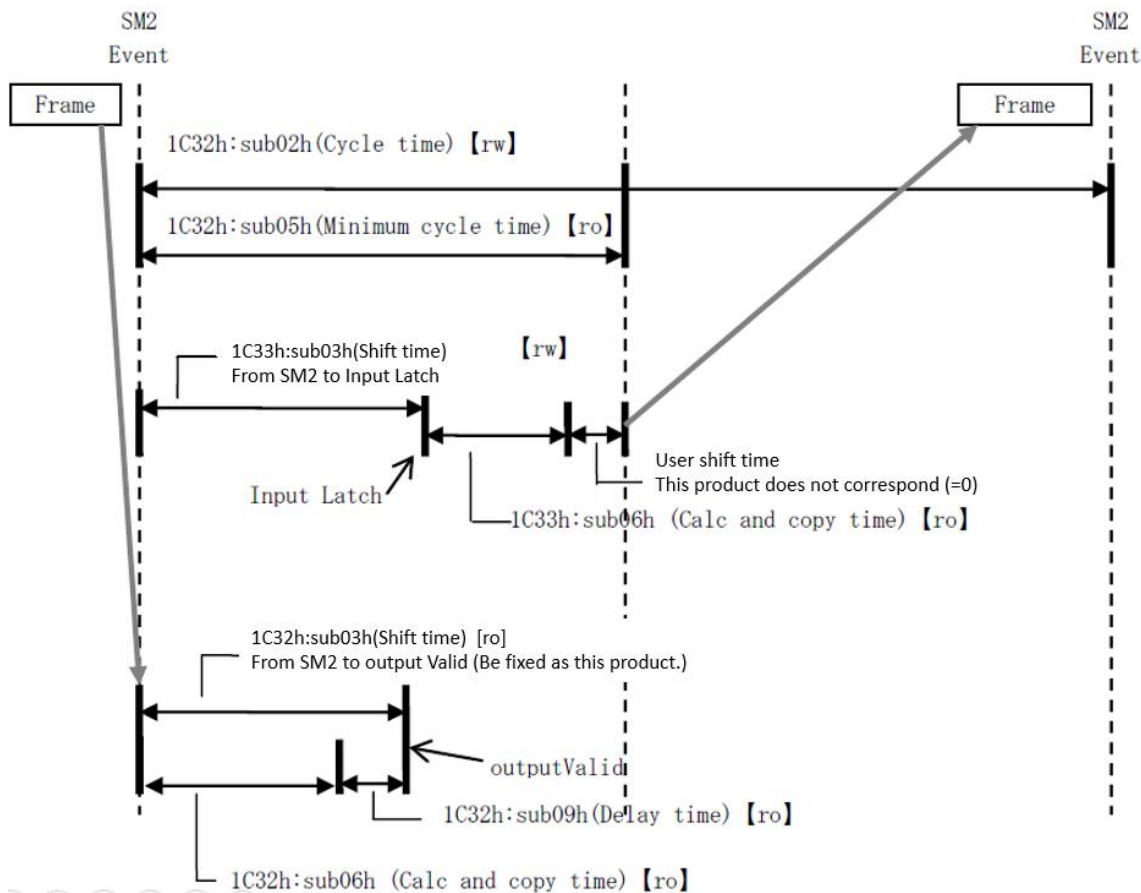

Index	Sub-Index	Access	Name	Value
1C33h	00h	RO	Numer of entries	The same setting as 1C32h: 00h.
	01h	RW	Sync mode	02h
	02h	RW	Cycle time	The same setting as 1C32h: 02h.
	03h	RO	Shift time	0
	04h	RO	Sync modes supported	bit4-2: DC synchronous type supported 001b: DC SYNC0 Event supported bit6-5: Input offset supported 00b: not supported
	05h	RO	Min cycle time	The same setting as 1C32h: 05h.
	06h	RO	Calc and copy time	100000
	09h	RO	Delay time	The same setting as 1C32h: 09h.
	0Ah	RO	Sync0 cycle time	The same setting as 1C32h: 0Ah.
	0Bh	RO	Cycle time too small	Not supported
	0Ch	RO	SM-event missed	Not supported
	0Dh	RO	Shift time too short	Not supported
20h	RO	Sync error	Not supported	

Note: this table only provides reference value, not to ensure content.

## 5.5.2 SM2(SM2 Event synchronization)

Synchronization method	feature
Synchronize with RxPDO's incoming time	No transmission delay compensation, poor precision The transfer time must be ensured on the upper side (dedicated hardware, etc.).

The specifications of SM2 mode in this servo driver are as follows:

SM2/3 setting in SM2 sync mode:

Index	Sub-Index	Access	Name	Value
1C32h	00h	RO	Numer of entries	20h
	01h	RW	Sync mode	01h
	02h	RW	Cycle time	100us: 100000    200us: 200000    500us: 500000 1ms: 1000000    2ms: 2000000    4ms: 4000000
	03h	RO	Shift time	Not supported
	04h	RO	Sync modes supported	00010b
	05h	RO	Min cycle time	17000
	06h	RO	Calc and copy time	100000
	09h	RO	Delay time	0
	0Ah	RO	Sync0 cycle time	The value of ESC register 09A0h
	0Bh	RO	Cycle time too small	Not supported
	0Ch	RO	SM-event missed	Not supported
	0Dh	RO	Shift time too short	Not supported
	20h	RO	Sync error	Not supported

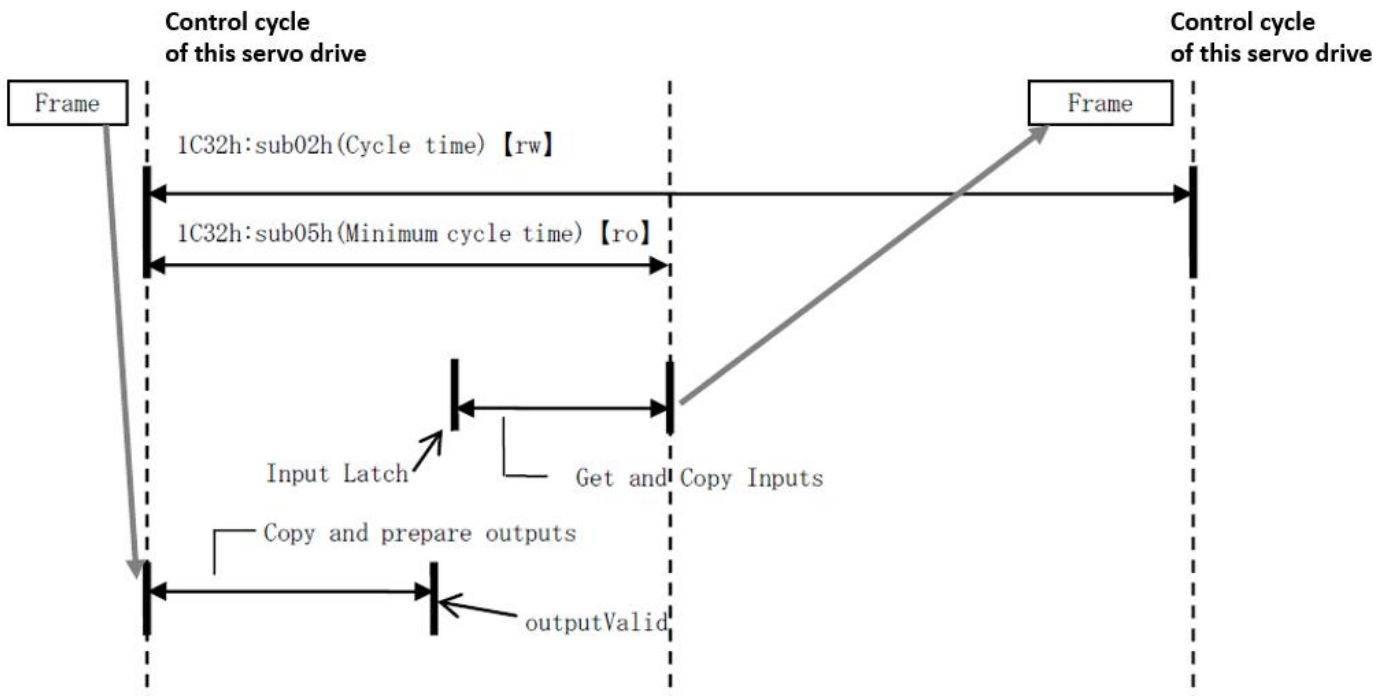

Index	Sub-Index	Access	Name	Value
1C33h	00h	RO	Numer of entries	The same setting as 1C32h: 00h.
	01h	RW	Sync mode	22h
	02h	RW	Cycle time	The same setting as 1C32h: 02h.
	03h	RO	Shift time	0
	04h	RO	Sync modes supported	The same setting as 1C32h: 04h.
	05h	RO	Min cycle time	The same setting as 1C32h: 05h.
	06h	RO	Calc and copy time	100000
	09h	RO	Delay time	The same setting as 1C32h: 09h.
	0Ah	RO	Sync0 cycle time	The same setting as 1C32h: 0Ah.
	0Bh	RO	Cycle time too small	Not supported
	0Ch	RO	SM-event missed	Not supported
	0Dh	RO	Shift time too short	Not supported
	20h	RO	Sync error	Not supported

Note: this table only provides reference value, not to ensure content.

### 5.5.3 Free Run(nonsynchronous)

Synchronization method	feature
Nonsynchronous	Simple processing Lack of real time

The specifications of FreeRun mode in this servo driver are as follows:

SM2/3 setting in FreeRun mode:

Index	Sub-Index	Access	Name	Value
1C32h	00h	RO	Numer of entries	20h
	01h	RW	Sync mode	00h
	02h	RW	Cycle time	100us: 100000    200us: 200000    500us: 500000 1ms: 1000000    2ms: 2000000    4ms: 4000000
	03h	RO	Shift time	Not supported
	04h	RO	Sync modes supported	00001b
	05h	RO	Min cycle time	17000
	06h	RO	Calc and copy time	Not supported
	09h	RO	Delay time	0
	0Ah	RO	Sync0 cycle time	Not supported
	0Bh	RO	Cycle time too small	Not supported
	0Ch	RO	SM-event missed	Not supported
	0Dh	RO	Shift time too short	Not supported
	20h	RO	Sync error	Not supported

Index	Sub-Index	Access	Name	Value
1C33h	00h	RO	Numer of entries	The same setting as 1C32h: 00h.
	01h	RW	Sync mode	00h
	02h	RW	Cycle time	The same setting as 1C32h: 02h.
	03h	RO	Shift time	Not supported
	04h	RO	Sync modes supported	The same setting as 1C32h: 04h.
	05h	RO	Min cycle time	The same setting as 1C32h: 05h.
	06h	RO	Calc and copy time	The same setting as 1C32h: 06h.
	09h	RO	Delay time	The same setting as 1C32h: 09h.
	0Ah	RO	Sync0 cycle time	The same setting as 1C32h: 0Ah.
	0Bh	RO	Cycle time too small	Not supported
	0Ch	RO	SM-event missed	Not supported
	0Dh	RO	Shift time too short	Not supported
	20h	RO	Sync error	Not supported

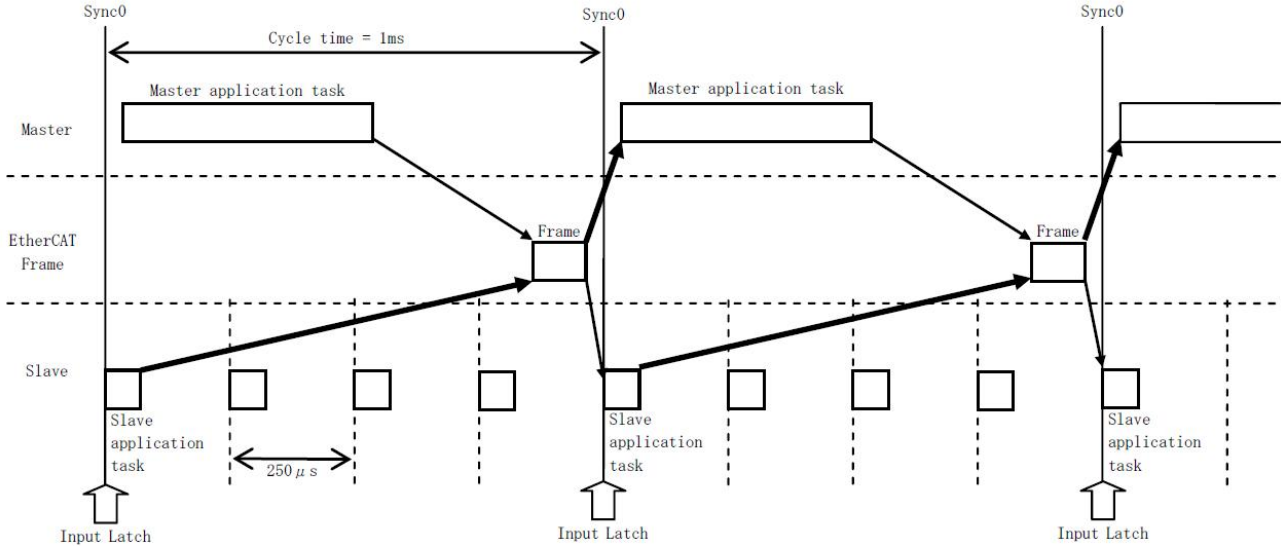

Note: this table only provides reference value, not to ensure content.

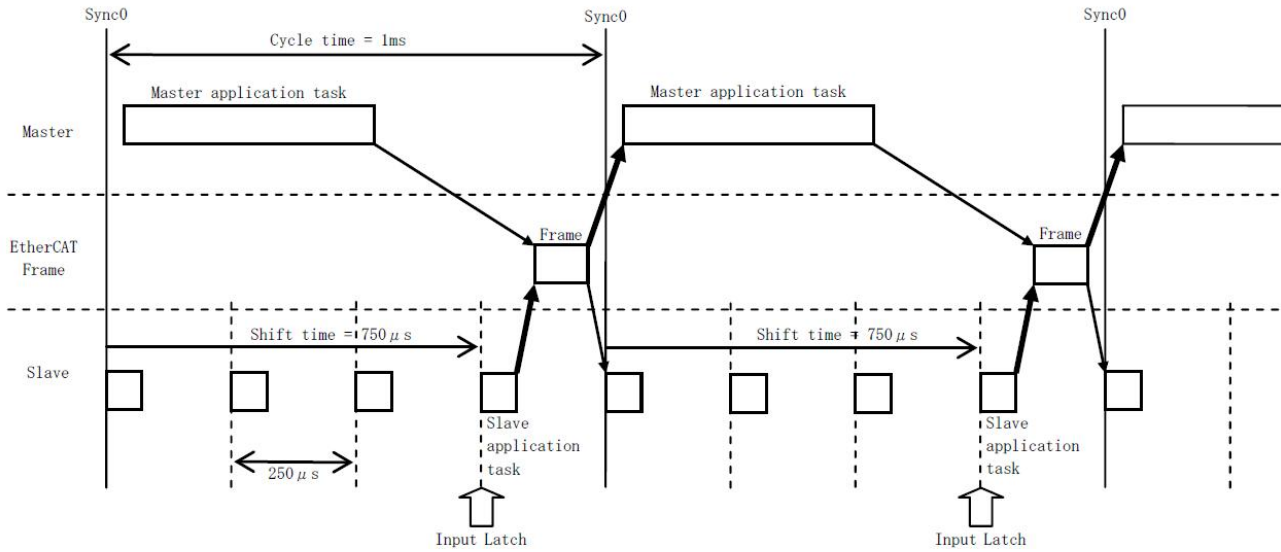

## 5.5.4 Input shift time

In order to provide the master station with the latest slave information, it corresponds to Input shift time. Setting 1C33h-03h to adjust the time of the Input Latch can be set as much as possible before the TxPDO frame is sent. Especially when the communication period (Cycle time) becomes longer, it is more effective.

<DC Cycle Time = 1ms, Input shift time = 0  $\mu$ s>

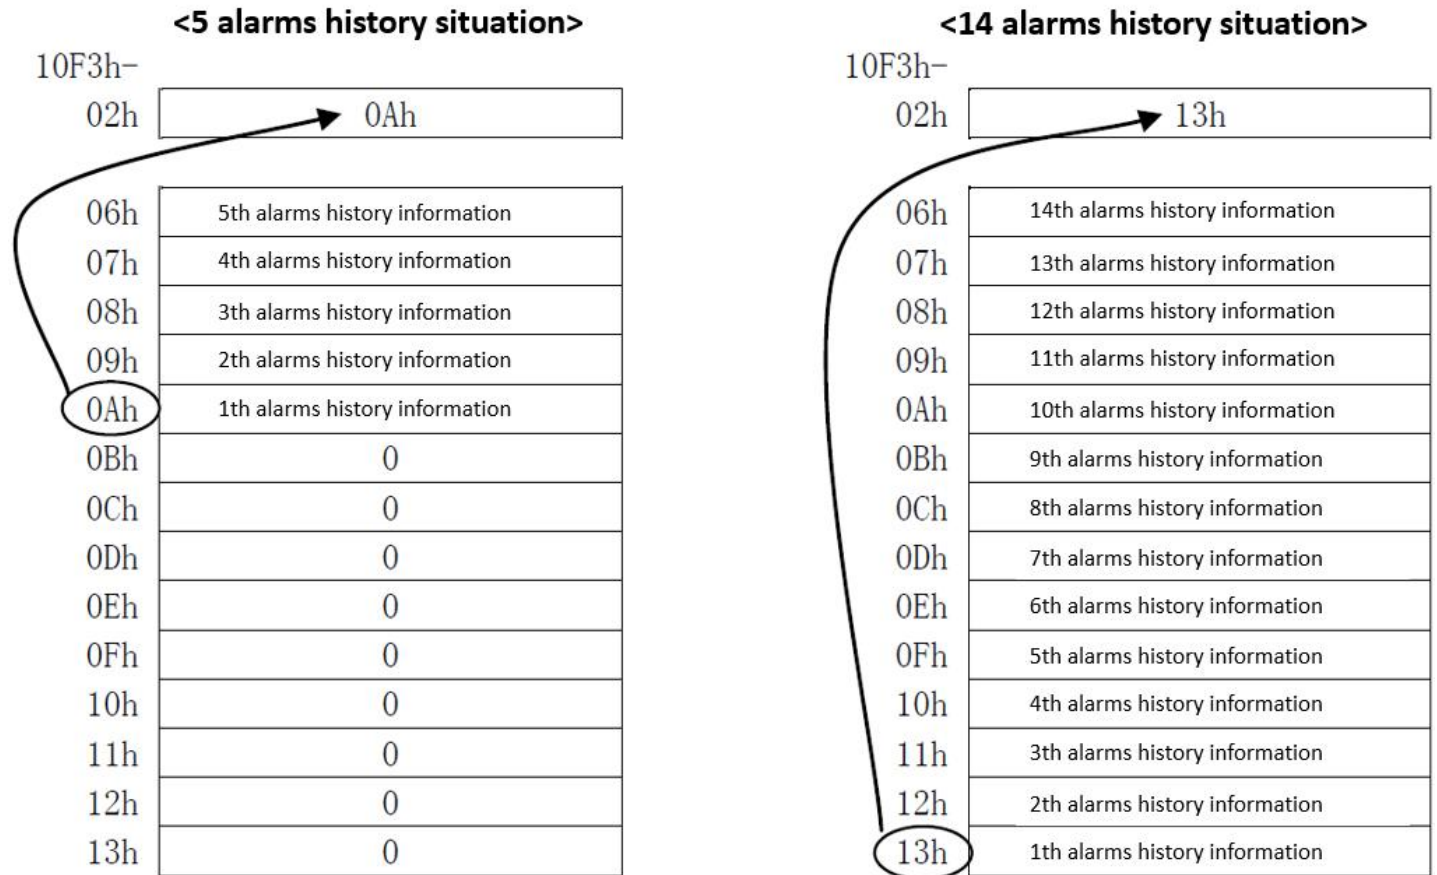

<DC Cycle Time = 1ms, Input shift time = 750  $\mu$ s>

## 5.6 Diagnosis history (Alarm resume reading function 10F3h)

We use object 10F3h (Diagnosis History) to read 14 alarm records.

The alarm record can be placed in the order of the most recent 14 alerts in order of 10F3h-06h (Diagnosis message 1) to 10F3h-13h (Diagnosis message 14). The latest alarm is placed in the Subindex confirmed by 10F3h-02h (Newest message).

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode
10F3h	--	Diagnosis history	--	--	--	--	--	--
		Execute alarm record read, as well as the Emergency message effective set is invalid.						
	00h	Numer of entries	--	0 - 255	U8	RO	No	ALL
		The number of objects assigned to this object is fixed at 13H.						
	01h	Max message	--	0 - 255	U8	RO	No	ALL
		This servo drive stores the maximum number of alarm information, which is fixed to 0Eh(14 times).						
	02h	Newest message	--	0 - 255	U8	RO	No	ALL
		Represents the Subindex of the latest alarm information store. When the alarm record is cleared, it is 0.						
	03h	Newest acknowledge message	--	0 - 255	U8	RW	No	ALL
		When reading: Return 0. At the time of writing: The set value 00h means to clear all Diagnosis messages, other values return SDO abort.						
04h	New messages available	--	0 - 1	bool	RO	No	ALL	
	Not supported, fixed to 0.							

		Flags	--	0 - 65535	U16	The following table	No	ALL
	05h	Bit 0	RW	0: Emergency message invalid 1: Emergency message effective				
		Bit4-1	R	Not supported, fixed to 0011b				
		Bit5	R	1: The clearance of the alarm record (10f3h-03h =0 write) is completed.				
		Bit15-6		Reserved				

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode									
10F3h	06h	Diagnosis message 1	--	--	OS	RO	No	ALL									
		Said alarm record															
		eg	00	E8	10	FF	02	00	00	00	00	00	00	00	00	00	0
		us	(L)	(H)	(L)	(H)	(L)	(H)	(L)	(H)							
		e	(fixed)		Error code		(fixed)		Text ID	(fixed)							
			Diag code			Flags		Text ID	Time stamp								
			Diag code	Identifying information diagnostic code, Error code is the return object 603F set value.													
			Flags	Fixed at 0002h													
			Text ID	The alarm code returns the defined Text ID. High 8-bit main alarm number, low 8-bit auxiliary alarm number.													
			Time stamp	The time when the exception occurred.													
	:								:								
	13h	Diagnosis message 14	--	--	OS	RO	No	ALL									
		Said alarm record, Content is the same as Subindex06h.

## 6.2 PDS Specification(Control state machine)

### 6.2.1 Equipment control state state machine

Master station through controlword to control the drive , through read drive’s statusword to learn the drive current status .

As shown above, state machine could be divided into three parts: “Power Disabled”“Power Enabled”and“Fault”. All state after the alarm turn into“Fault”. And after power on, the drive initialized, and turn into SWITCH\_ON\_DISABLED state. On the condition , could be communicated with , and could setting the drive ( e.g , set the drive’s operating mode to“PP”mode). At this point , the power remains disabled , and motor is under-excitaiton. After through state transmit2、3、4 , enter OPERATION ENABLE. At this point , the power enabled , drive control the motor in line with the configuration operating mode. In consequence, verify the drive parameter configured in right way and relevant input value as 0 before this condition. State transmit 9 complete the power disabled . Once the drive alarm, the drive state enter FAULT.

### 6.3 Control word (6040h)

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode						
6040h	00h	controlword		0 - 65535	U16	rw	RxPDO	ALL						
		Setting PDS(control state machine)state transition and servo drive command instruction												
		Bit specification:												
		15	14	13	12	11	10	9	8	7	6	5	4	3
r			oms		h	fr	oms			eo	qs	ev		
r		reserved				eo		enable operation						
oms		operation mode specific				qs		quick stop						
h		halt				ev		enable voltage						
fr		fault reset				so		switch on						

Bit0 ~ 3 and Bit7:

State machine transmission with the 5 bit formed the relevant command instruction trigger.

Command	Bit of the <i>controlword</i>					Transitions
	Fault reset	Enable operation	Quick stop	Enable voltage	Switch on	
Shutdown	0	X	1	1	0	2,6,8
Switch on	0	0	1	1	1	3*
Switch on	0	1	1	1	1	3**
Disable voltage	0	X	X	0	X	7,9,10,12
Quick stop	0	X	0	1	X	7,10,11
Disable operation	0	0	1	1	1	5
Enable operation	0	1	1	1	1	4,16
Fault reset		X	X	X	X	15

PS: In the table the bit could be neglect with “X”;

Bit4、 5、 6、 9:

The 4 bits in different modes, different definition。

opm	bit9	bit6	bit5	Bit4
pp	change on set_point	abs/rel	change set immediatly	new set point
pv	Reserved	Reserved	Reserved	Reserved
tq	Reserved	Reserved	Reserved	Reserved
hm	Reserved	Reserved	Reserved	start homeing
ip	Reserved	Reserved	Reserved	enable ip mode
csp	Reserved	Reserved	Reserved	Reserved
csv	Reserved	Reserved	Reserved	Reserved
cst	Reserved	Reserved	Reserved	Reserved

Other bit: all is reserved bit.

## 6.4 Status word (6041h)

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode							
6041h	00h	statusword		0 - 65535	U16	ro	TxPDO	ALL							
Indicate servo drive state.															
Bit specification:															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
r		oms	ila	oms	rm	r	w	sod	qs	ve	f	oe	se	rso	
r		oms	ila	oms	rm	r	w	sod	qs	ve	f	oe	se	rso	
									qs	quick stop					
									ve	voltage enable					
									f	fault					
									oe	operation enabled					
									se	switched on					
									rso	ready to switch on					

Bit0 ~ 3 、 Bit5 和 Bit6:

These bits group indicate drive in the PDS state。

State word	PDS state	
xxxx xxxx x0xx 0000 b	Not ready to switch on	Initialization incomplete state
xxxx xxxx x1xx 0000 b	Switch on disabled	Initialization complete state
xxxx xxxx x01x 0001 b	Ready to switch on	Main power OFF state
xxxx xxxx x01x 0011 b	Switched on	Servo on enabled OFF/servo in ready state
xxxx xxxx x01x 0111 b	Operation enabled	Servo on enabled ON
xxxx xxxx x00x 0111 b	Quick stop active	Stop
xxxx xxxx x0xx 1111 b	Fault reaction active	Error judgement
xxxx xxxx x0xx 1000 b	Fault	Error state

Bit4: Voltage enabled

When the bit display 1, indicate power enabled。

Bit5: Quick stop

when the bit display 0, indicate the drive stop according to the setting (605A n: quick\_stop\_option\_code)。

Bit7: Warning

When the bit display 1, indicate the drive detect alarm。

Bit10、12、13:

These three bits in different control mode, different implicatin.

opm	bit13	Bit12	Bit10
pp	following error	set-point acknowledge	target reached
pv	max slippage error	speed	target reached
tq	Reserved	Reserved	target reached
hm	homing error	homing attained	target reached
ip	Reserved	Reserved	target reached
csp	Reserved	Reserved	Reserved
csv	Reserved	Reserved	Reserved
cst	Reserved	Reserved	Reserved

Bit11: Internal limit active

When the bit display 1, indicate inner torque exceed set value。

Other bit:

All is reserved bit。

## 6.5 control mode setting

### 6.5.1 Supported drive modes (6502h)

The supported drive modes could be confirmed on 6502h(Modes of operation)。

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode					
6502h	00h	supported drive modes	--	0 - 4294967295	U32	ro	TxPDO	ALL					
Supported drive modes 0 nonsupport 1 support 。													
Bit indication:													
31-16		15-10		9	8	7	6	5	4	3	2	1	0
ms		r		cst	csv	csp	ip	hm	r	tq	pv	vl	pp
0		0		1	1	1	1	1	0	1	1	0	1
ms		Manufacturer specific					r reserved						

### 6.5.2 Modes of operation (6060h)

Drive modes setting by 6060h to proceed。

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode					
6060h	00h	modes of operation	--	-128 - 127	U8	rw	RxPDO	ALL					
Drive modes setting:0 nonsupport, 1 support													
Bit indication:

## 6.6.2 Position control mode (PP)

Specified object position、object speed and speed-up and speed down, drive position instruction generated modes

1) PP position mode associated object (instruction)

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode
6040h	00h	controlword	--	0 - 65535	U16	rw	RPDO	
60F2h	00h	positioning option code	0.1%	0 - 32767	U16	rw	RPDO	

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode				
6040h	00h	controlword	--	0 - 65535	U16	rw	RPDO					
		Setting drive other to PDS(control state machine)state transfer										
		Bit indication:										
		15...10	9	8	7	6	5	4	3	2	1	0

r	oms	h	fr	oms			eo	qs	ev	so
	change on set-point			absolute/relative	change set immediately	new set-point				
r	reserved					eo	enable operation			
oms	operation mode specific					qs	quick stop			
h	halt					ev	enable voltage			
fr	fault reset					so	switch on			

bit9, 6-4(oms):

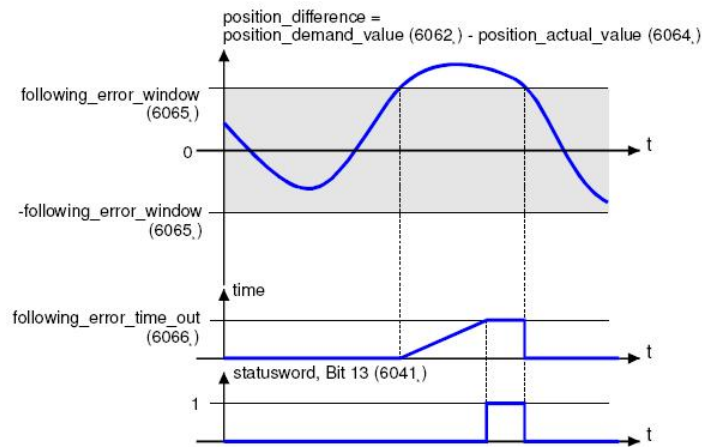

bit	Name	Value	Specific
4	new set-point	0 -> 1	Positioning enable, setting value update trigger。
5	change set immediately	0	Current positioning finished, proceed to next positioning。
		1	Interrupt current positioning, promptly proceed to next positioning。
6	absolute/relative	0	target position(607Ah)as absolute position to process
		1	target position(607Ah)as relative position to process
9	change on set-point		Nonsupport

## 2) PP position modes associated object(monitor)

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode									
6041h	00h	statusword	--	0 - 65535	U16	ro	TPDO										
		Drive state.															
		Bit indication:															
		15-14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
		r	oms		ila	oms		rm	r	w	sod	qs	ve	f	oe	se	rso
			following error	set-point acknowledge		target reached											
		r	reserved				qs	quick stop									
		oms	operation mode specific				ve	voltage enable									
		ila	internal limit active				f	fault									
		rm	remote				oe	operation enabled									
		w	warning				se	switched on									
		sod	switch on disabled				rso	ready to switch on									

bit13-12, 10(oms):

bit	Name	Value	Specific
10	target reached	0	halt=0: positioning unfinished; halt=1: shaft decelerating;
		1	halt=0: positioning finished; halt=1: shaft stopped;
12	set-point acknowledge	0	The data buffer used to positioning is empty.
		1	The data buffer used to positioning is full.
13	following error		Refer to the illustration below

Following error –features

Other position control in common associated object, refer to 6-6-1。

### 3) PP positioning modes

\* move 1 (basic set-point)

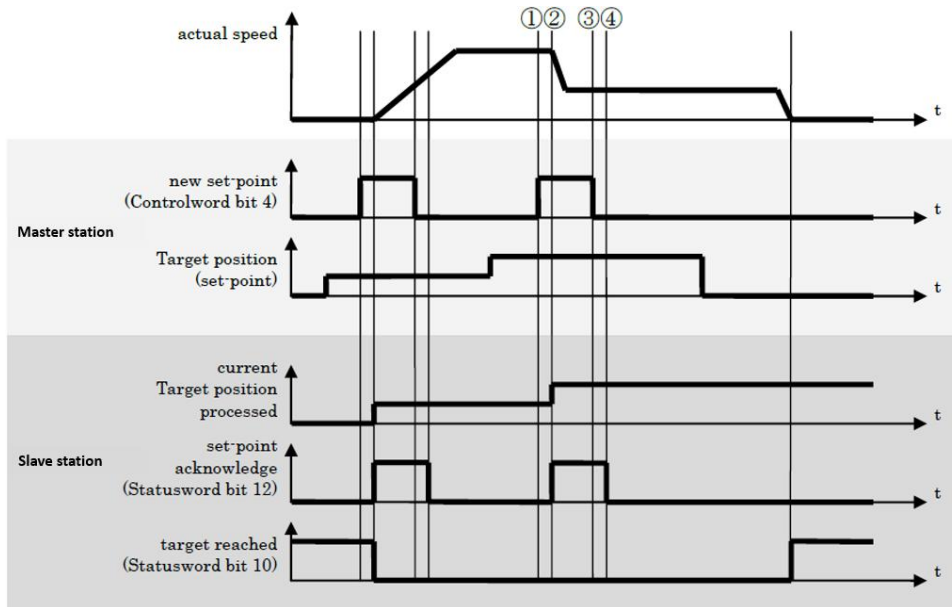

- ① master station setting target position(607Ah), make controlword(6040h)bit4(new set-point)from 0 to 1。
- ② slave station controlword(6040h)bit4(new set-point)rising edge , target position(607Ah)as target position begin to position。 At this point change statusword (6041h)的 bit12(set-point acknowledge)from 0 to 1。
- ③ After master station confirm statusword (6041h)的 bit12(set-point acknowledge)rising edge ,set controlword(6040h)bit4(new set-point) to 0。
- ④ controlword(6040h)bit4(new set-point)as 0, statusword (6041h)的 bit12(set-point acknowledge)as 0。
- ⑤ When slave station reached tarfet position, make statusword (6041h)的 bit10(target reached)as 1。

\*move 2 (no buffering move data modification: single set-point)

Master station controlword(6040h)bit5(change set immediately)as 1, modified positioning data , slave station will interrupt current positioning move, proceed to next positioning move。

- ① master station confirm statusword (6041h)bit12(set-point acknowledge)as 0 , after setting new target position(607Ah)or profile speed(6081h), make controlword(6040h)bit4(new set-point)from 0 to 1。
- ② slave station confirm controlword(6040h)bit4(new set-point)rising edge , target position(607Ah)as target position update promptly。 At this point change statusword (6041h)bit12(set-point acknowledge)from 0 to 1。
- ③ After master station confirm statusword (6041h)bit12(set-point acknowledge)rising edge , set controlword(6040h)bit4(new set-point) to 0。
- ④ controlword(6040h)bit4(new set-point)as 0, statusword (6041h)bit12(set-point acknowledge)as 0。

\* move 3 ( data modification in buffering moves: set of set-point )

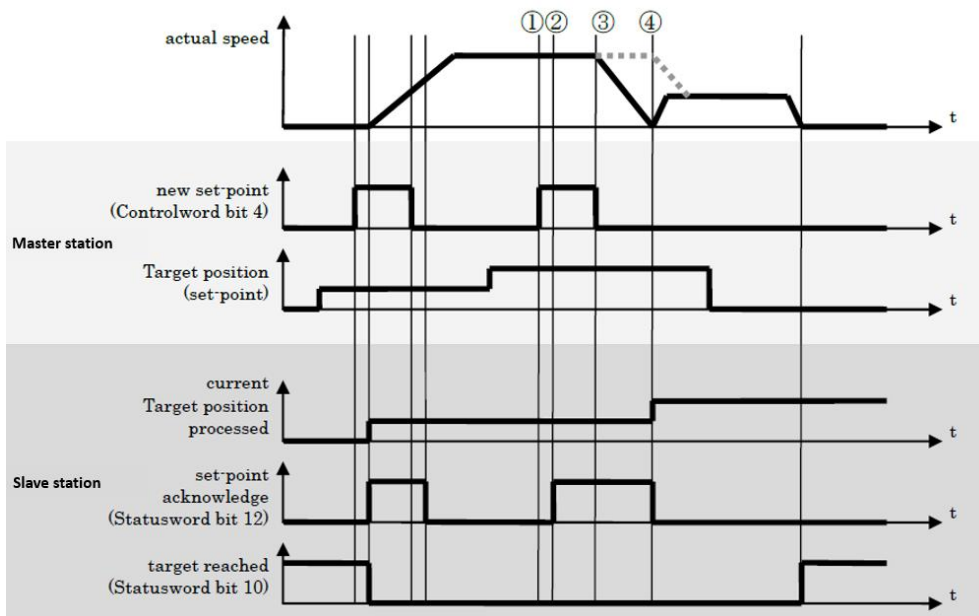

Master station controlword(6040h)bit5(change set immediately)as 0, modified positioning data, slave station start to next positioning move before finished current positioning move.

① master station confirm statusword (6041h)bit12(set-point acknowledge)as 0, after setting new target position(607Ah) or profile speed(6081h), make controlword(6040h)bit4(new set-point)from 0 to 1.

② slave station confirm controlword(6040h)bit4(new set-point)rising edge, target position(607Ah)as new target position to buffer. At this point statusword (6041h)bit12(set-point acknowledge)from 0 to 1.

③ After master station confirm statusword (6041h)bit12(set-point acknowledge)rising edge, setting controlword(6040h)bit4(new set-point) as 0.

④ slave station confirm controlword(6040h)bit4(new set-point)as 0, and confirm the running positioning move finished, after use new target position start to positioning, make statusword (6041h)bit12(set-point acknowledge)as 0.

10	r	--	Reserved
12	drive follows command value	0	Not Perform this action based on the target speed
		1	Perform this action based on the target speed
13	r	--	Reserved

Csv Control mode action:

Cycle Speed control mode, the trajectory generation is not in the slave station but is made by the master station.

Target speed is the added value of 60FFh (target speed) and 60B1h (speed offset).

Interpolation time period (60C2h), represents the period of updating two targets of target position (607Ah) and position offset (60B0h). This value is set to the same period as cycle time (1C32h-02h).

## 6.8 Torque control function (pt/cst)

bit13-12, 10(oms):

bit	Name	Value	Specific
10	r	--	Reserved
12	drive follows command value	0	Not Perform this action based on the target speed
		1	Perform this action based on the target speed
13	r	--	Reserved

Cst control mode action:

Cycle torque control mode, the trajectory generation is not in the slave station, but by the master station planning.

The target speed is the additive value of 6071h (target torque) and 60B2h (torque offset).

Interpolation time period (60C2h), represents the period of updating two targets of target position (607Ah) and position offset (60B0h). This value is set to the same period as cycle time (1C32h-02h).

## 6.9 Mode common function

### 6.9.1 Touch probe function

This function selects the clamp trigger signal from the external input (EXT1/EXT2) or Z-phase, locking the feedback device.

If the trigger signal uses an external input (EXT1/EXT2), assign the input port to EXT1, EXT2 via parameters Pn511.1 and Pn511.2 respectively..

Clamp trigger use external input (EXT1/EXT2) to send the Acquired error, please make sure the speed as low as possible which nearby clamp trigger input signal.

If,

1) touch Functional composition

(TBD)

2) Touch probe Associated objects

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode

	1	Touch probe 2 negative edge value stored	Falling edge Touch probe 2 completed
11-13	--	reserved	Reserved
14-15	--	Not support	Reserved

5) Touch probe position 1/2 positive value (60BAh-60BDh)

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode
60BAh	00h	touch probe pos1 value+	Command unit	2147483648 – 2147483647	I32	ro	TPDO	ALL
		Represents the position of the rising edge of touch probe 1						
60BBh	00h	touch probe pos1 value+	Command unit	2147483648 – 2147483647	I32	ro	TPDO	ALL
		Represents the position of the falling edge of touch probe 1						
60BCh	00h	touch probe pos2 value+	Command unit	Command unit	I32	ro	TPDO	ALL

		Represents the position of the rising edge of touch probe 2						
60BDh	00h	touch probe pos2 value-	Command unit	2147483648 – 2147483647	I32	ro	TPDO	ALL
		Represents the position of the falling edge of touch probe 2						

6) Start of touch probe action

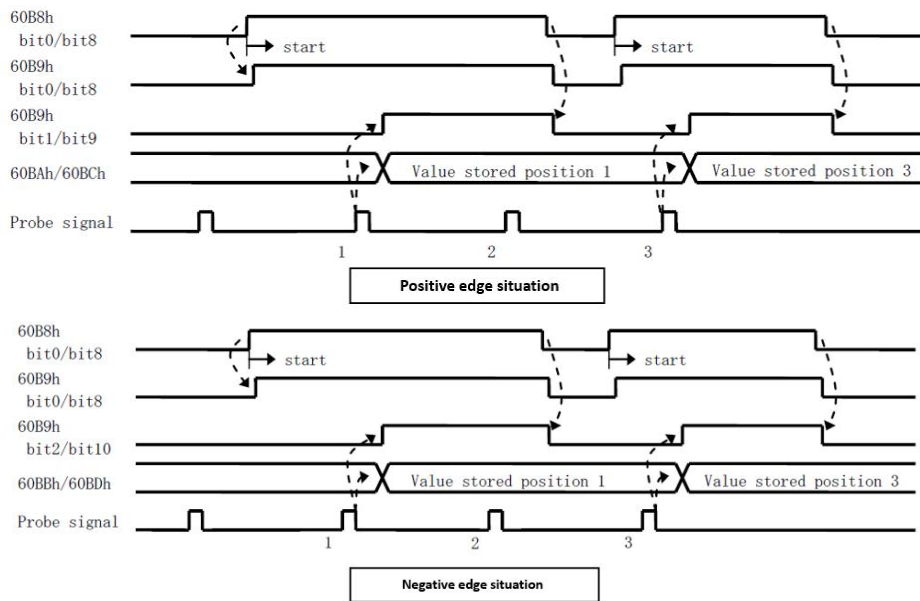

Bit 0/8 of touch probe function (60B8h) is 0->1, and various setting conditions (60B8h: bit1-7/bit9-15) are acquired, and touch probe operation is started..

Changes to various setting conditions are valid. Please reset bit0/8 to 0 and then again to 1.

7) touch probe Event mode

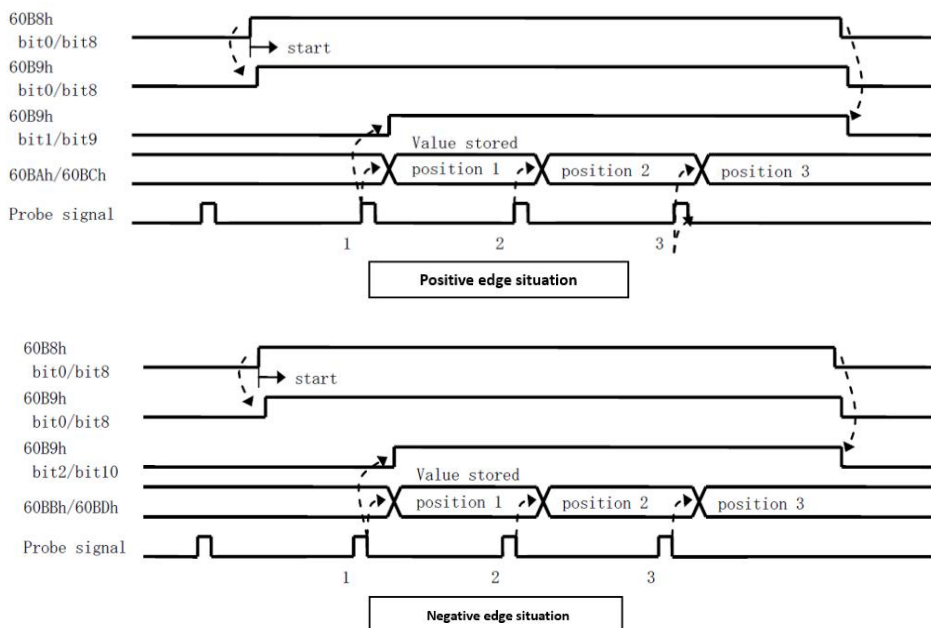

<Trigger first event mode> (60B8h:bit1/9 = 0)

After starting, the position is only clamped on the first trigger signal. In order to get the position again, you need to start the touch probe again.

<continuous mode> (60B8h:bit1/9 = 1)

After start-up, the position of the embedment occurs each time a trigger signal occurs. The acquired value is saved to the next probe signal.

## 6.9.2 Digital inputs/Digital outputs

Bits of Digital inputs / Digital outputs are assigned by servo parameters Pn509-514 (OD: 3509h-3514h) and indicate the input states of /POT, /NOT, /HM-REF, EXT1, EXT2, and IN1-IN8.

### 1) Digital inputs

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode	
60FDh	00h	Digital inputs	--	0 - 4294967295	U32	ro	TPDO	ALL	
Indicates the input status of the external input									
bit	31	30	29	28	27	26	25	24	
Func	Reserved								
bit	23	22	21	20	19	18	17	16	
Func	IN8	IN7	IN6	IN5	IN4	IN3	IN2	IN1	
bit	15	14	13	12	11	10	9	8	
Func	Reserved								
bit	7	6	5	4	3	2	1	0	
Func	Reserved					/HM-REF	/POT	/NOT	

### 2) Digital outputs

Index	Sub-Index	Name	Unit	Range	Type	Access	PDO	OP-mode
60FEh	--	Digital outputs	--	--	--	--	--	--
